

Millennial Hospitality VI

A photograph of a man with short brown hair and a slight smile, wearing a black long-sleeved shirt. He is standing in a snowy mountain landscape, with his right arm raised and resting on a wooden post. The background features snow-covered mountain peaks under a bright blue sky with scattered white clouds. The overall scene is bright and scenic.

Who created all. Extraterrestrials included.

Acknowledgements

I am unable to send this for publication without thanking my loving wife Marie Therese of 50+ years for her patience and understanding in all aspects of my endeavors, and especially for her constant encouragement.

Forward

We are so happy to finally have a book devoted to the people Charles calls, the Norwegians With 24 Teeth. If you are like me, you may have been wondering why it took so long, for him, to get around to it.

To clarify: The people Charles refers to as Norwegians With 24 Teeth, should never be confused with anything others may have written or spoken about as 'Nordics'. The NW24T, are much like us, except for their dental structure, and their unusually calm disposition. They are not given to nervous tics, crossing & uncrossing legs, or other excess movements. Whether 'Nordics' exist or not, is to be determined. Charles tries never to speculate on any other than his own experiences.

Meeting a man who claimed to have come from another planet, a friend's relative, & reading statistics on the German death camps, before he'd even gone into the Air Force, no doubt contributed to his orderly processing of his exposure to both the Tall Whites & the Greys, in contrast to the weather observers, who preceded him.

After all, we need to learn $2 + 2 = 4$, & 'See David Run', before graduating to Calculus & Plato's Republic.

We hope you will enjoy Charles' early encounters with NW24T, and you will find recent, very public observations to be of sufficient proof that these people, who have been here for a very long time, are now coming in larger numbers. Charles' work reminds us of the work we humans must do, in order to welcome them & other off planet travelers.

Additionally, we do not know the name the NW24T people actually call themselves, or by what name they call their home star or their home planet. We hope they will soon be able to tell us in person, themselves.

Be not forgetful to entertain strangers,
for thereby some have entertained angels
unawares.

... Hebrews 13:2(KJV)

When I was a teenager growing up in Southern Wisconsin, my friends and I used to play a friendly, happy game. It was called “Who has the most unusual relative?” We quickly learned to never play the game with Connie (not her real name). She always won. She always had the most unusual relatives.

Like me, she was a high honor student. She was generally truthful. We shared many hopes, values, and dreams. However, a number of our other hopes, values, and dreams did not match up very well. Teenagers that we both were, this limited our friendship. It also limited the crowd I belonged to.

Connie was part of a very small group of “In Crowd” friends. They went places and did things together. I was not actually part of her “In Crowd”. In the end, we all remained just good friends.

One fall afternoon, Connie and myself were sitting around and talking together. Connie started first. She began talking in excited tones. She obviously wanted to play the game and to have some fun.

She had a distant uncle, she said, on her father’s side of the family. He was coming to visit them again this week. Everyone in her family liked him. He was very intelligent. He was a pleasant and an unusually calm person. Everyone in her family looked forward to his visits. He didn’t come very often.

When he did come, Connie loved talking with him about astronomy, the Milky Way, and the other stars in the night time sky. He had many unusual stories and observations. Connie wanted me and her other in-crowd friends to meet him when he arrived in a few days.

The uncle wasn't married, even though he appeared to be in his late thirties. Nice as he was, finding a suitable wife had apparently been difficult for him. When asked, he would just say that so far, he was unable to find another eligible young woman who was like himself.

Connie's uncle never wanted any particular attention. He was just a nice, pleasant guy who seemed to always be happy. When he came, he loved to work outside in the warm sunshine and in the fields and pastures on her family's large farm. He loved to help her father out in the barn or anywhere else on the farm. He also loved to work with some of the animals, but not all.

One time, Connie's uncle and her father were working together with pitchforks in the barn. They were spreading straw. Connie's father accidentally hit her uncle in the jaw with the end of his pitchfork. The blow knocked out one of her uncle's teeth. It was one of his lower back molars. Connie's father swore that the blow wasn't particularly hard. Yet the molar, still in perfect condition, came out, short roots and all. It came out quickly and intact.

Connie's father, having caused the accident, was embarrassed and horribly ashamed of himself. Her father immediately brought the uncle up to the farm house to see what could be done.

However, the uncle, obviously was not in any pain or distress, just shrugged off the entire incident. Connie's uncle wasn't angry or anything. He just said the tooth had been loose and was going to come out in a few days anyway.

The uncle insisted that Connie's father shouldn't think anything of the accident. "It's nothing." He insisted. Her uncle was certain another molar would grow in and replace the lost molar within a few weeks. And sure enough, insisted Connie, the next time her uncle came to visit, a new molar had grown in, replacing the lost molar. On that next visit, her uncle just smiled and said he had another tooth that was loosening. It would soon be naturally replaced as well.

I didn't know quite what to think. We were both certain that it is biologically impossible for any adult human to regrow even a single lost tooth of any kind. Also, human molars have long roots.

After a long pause, Connie continued.

Connie had an aunt on her father's side who lived alone in another nearby small town in Wisconsin. Her aunt was an only child who had never married. The young man of her dreams had been killed in World War II. He had died heroically, somewhere in Europe. Connie didn't say where. Connie's aunt was still mourning him.

Both of the aunt's parents had died while her aunt was still a teenager. They left her with the house and a reasonable inheritance. Her aunt still owned the house and she was living in it. The aunt had a college education. She worked at her local library. She liked to sew, knit and crochet. Although she was living a lonely life, a nostalgic life full of memories, she was reasonably happy and well off.

Just after the end of World War II, on a warm pleasant early summer day, her aunt was sitting in a rocking chair on her front porch. She was knitting. A young man carrying a single medium sized travel bag came walking up the street. He came from the direction of the train station. When he arrived next to her house, he turned in to her front walk, and slowly approached her as she remained sitting on the porch. He was very polite. He introduced himself. He said he was her long lost uncle from northern Europe. He spoke good English, although with a European accent. Now that the war was over, he had decided to come to America.

He said the ship which had brought him had crashed on the coast. He didn't say where the crash had occurred, or which coast it had occurred on.

He said that repairing the ship was expected to take perhaps 5 or 7 years. He said he would not be able to return to his home in Northern Europe until his ship was repaired. He implied that he might have to stay in America for as long as 20 years.

He seemed to know a great deal about her aunt, about her family history, and about the small towns in the area. In fact, he seemed to know a great deal about the entire Madison and southern Wisconsin area.

He politely asked Connie's aunt if she would sponsor him, so he could stay in America until his ship was repaired and he could return to his home. He was very well prepared. He had a significant amount

of money. He promised to pay for her time and to pay all expenses. He said he expected to rent a room downtown at one of the local hotels. He intended to get a job in nearby Madison, Wisconsin. He intended to buy a car and get his driver's license. He would need to open a bank savings account for the money he had brought with him. He also wanted to become an American citizen. He said he would need her help in order to do all of those things.

He also said that in the coming weeks and months he would need help dealing with the weather, the climate, the plants and animals, the seasons, and the storms. He said he wanted to fit in to the local culture and to learn the local customs. He wanted to relax, picnic, and quietly enjoy living here in the area for a while. He hoped he could live in this area until it was time for him to return home. He liked the area because it reminded him so much of his home, which was far away. He considered this to be a nice area where he could quietly have some fun.

Connie's aunt was happy to agree. She said she would help him for free. He was, after all, family.

The aunt put down her knitting, and took it into the house. Using her car, she began by driving him downtown so he could rent a room, and open a bank account. The two of them shared a good meal. Connie said the new uncle was always polite, happy, and as good as his word. He had a good deal of money. He always paid for everything.

Connie's aunt and the new uncle had fun together. They would picnic together now and then. Her new uncle always enjoyed it.

The aunt helped him buy a new car. She continued by teaching him how to drive it. Connie told how both her aunt and her new uncle were laughing when the new car bumped up on the curb in front of her aunt's house. It happened the first time her aunt was trying to teach her new uncle how to parallel park. Apparently finding the brake on a car with a stick shift wasn't as easy for her new uncle as her aunt thought it would be.

Soon Connie's new uncle had a local safe place nearby. He also had a nice place up in Madison to work, and a good supply of food in the cupboard. He was driving a new car and attending citizenship

classes. In short, her new uncle was very happy, and was happily settled in. Also, he had a small group of very quiet, respectable looking friends, who lived in the Madison area. They would visit him from time to time. They all seemed to have money, quietly have fun, and enjoy themselves.

Connie reminisced about the first time her aunt had brought her new uncle over to Connie's family farm and introduced the uncle to her father and mother. It had been several years prior. They all enjoyed a very pleasant late family dinner, including the new uncle.

They were seated around the large family table in the dining room. They talked together until well into the night, and laughed a lot.

At the dinner table, Connie's father carefully pointed out that no-one in the family had ever heard of the new uncle before he introduced himself to her aunt. Connie's father was pleasantly wondering how the uncle had been able to locate the aunt. Connie's new uncle replied, smiling, that he had learned of the aunt from his other friends and relatives in Northern Europe.

The new uncle identified a number of other distant family relatives here in America. He quoted a few names and birth dates and a few other family stories. He identified a few of the family heirlooms. He also related a few pieces of information regarding her aunt's earlier years.

The new uncle praised the aunt highly. Apparently, all of his friends and relatives had the highest respect and admiration for the aunt. They all wanted the very best things for her. They also wanted the aunt and the rest of her American family to be happy.

Connie's father asked how the uncle knew so much about the southern Wisconsin area. The uncle responded that before he left his home, which was very far away, he read extensively about Madison and southern Wisconsin in some of his favorite books. He said the books were in his favorite library, which also was very far away. Apparently, there was also another library on the ship on which he traveled.

The uncle had chosen to come to southern Wisconsin and the Madison area because it was so much like his far away home.

Connie's father seemed impressed. Everything about the uncle's trip seemed so well planned.

Connie's mother and her aunt were happy and well pleased. They were quite certain the new uncle was authentic. Connie's father just smiled and welcomed the new uncle into the family.

Later in the evening, after the aunt and the new uncle had left, Connie's father voiced his doubts. Her father said the new uncle was as nice and honorable a man as he had ever met. However, the father was convinced that most every story or item of information which the new uncle related, was readily and publicly available from the people and libraries in the area, or from the State and County records stored in various State Office buildings located in Madison. The aunt had, after all, grown up in the area. She had also worked as the local librarian for several years. She was well off financially. A lot of people knew a lot about her.

Then there was the matter of the new uncle's ship crashing on a coast line. The large amount of money the uncle had shown up with was in American dollars. Someone had given it to him after the crash on the unfriendly coast. Connie's father felt like something was out of place.

Connie's mother pleasantly responded that Connie's father's doubts were pretty silly. She quickly pointed out how widely scattered such public record storage buildings were. Her mother pointed out that if the father's doubts were justified, it would mean that the new uncle would not be acting alone. He would have to have had several other people helping him, just to read all of those records and books, and to quietly talk with all of those people, in a reasonably short time. He and his friends would have had to spend a great deal of time in libraries, not just libraries here in Wisconsin and on board his ship. Wherever he came from, he and his friends would have had to have spent a great deal of time in large libraries located very far away.

Then there was the fact that World War II had just recently ended. Europe was full of groups of refugees who wanted to come to America. The U.S. Government had lots of government employees

both here in the U.S., and overseas, whose jobs were simply to help process the immense flood of refugees.

Connie's mother brushed away the father's doubts by just saying that Europeans who had helped the Americans win the war were probably just getting well deserved preferential treatment if they wanted to come to America.

Connie's father ended the pleasant conversation by agreeing that her mother was probably correct. In any event, her father stated, the new uncle must be quite intelligent. "Just think of all of the facts and information about the aunt and her family the new uncle had remembered." Just assembling that much information, alone, and then remembering it, he said, must have taken her uncle some effort.

Connie continued. The new uncle would come and visit them regularly. The uncle had become quite good friends with the entire family. In the evenings, when he came, Connie and her uncle enjoyed sitting on the porch in their two large lawn swings, looking up at the stars.

The uncle seemed to know a tremendous amount about the stars. For example, he knew many of their names. The uncle always insisted that the stars looked different when a person was out in space. For example, in outer space, the stars did not twinkle.

The uncle stated that some stars were not actually very far away, and they were constantly moving. He said those stars had positions today, which were very different from the positions we see them in, from here on the ground.

He insisted that when a person was out in space, all of the stars had different colors. Some, he said, were large and blue-white. Others were small and red. Some stars, he said put out large eruptions and flares from time to time. Some were alone in space. Others were in groups. Some orbited around each other.

One evening, Connie asked her uncle about how his ship had crashed. She asked if he had been injured.

Her uncle wouldn't say very much about the ship's crash. Connie's uncle would relate the story only once.

What he did say was that when they were coming in, the captain looked ahead and saw very bad conditions at the planned landing

site. Apparently, the planned landing site was covered in ocean water. The ship's captain was forced to take the ship off course, and go searching for better landing conditions. As the ship slowed down, it was becoming harder for the captain to control. The ship traveled a long distance to the south. The uncle implied the ship had traveled a distance something like the distance from New York City to Miami Florida before the captain found a place on the coast where he could make a forced landing. The landing on the coast had done a lot of damage to the ship. However, the captain had done a good job. No one was injured.

Connie noticed her uncle never used the word "if" when talking about being out in space. It sounded to her as if her uncle had actually been out in space. Then one evening, Connie decided that her suspicions could not possibly be correct. Her uncle seemed to be describing various views of space and of the solar system which no human could ever have seen. They sounded like distant views of the Earth and the Moon from out in space and perhaps, up over the north pole. Connie decided that if her uncle had actually been out in space, and seen those things, he wouldn't need her aunt's help in learning to drive a car. It must just be the way her uncle is, Connie decided.

One summer evening, when Connie and her uncle were talking, while sitting on the two porch swings, she asked her uncle about his future plans. Since he was happy here in Southern Wisconsin, she wondered if he would still want to return to his home in 20 years. After all, she said, in 20 years, the uncle, her mother, and her father would all be old people. It's very hard for old people to travel and to move to faraway places.

Caught off guard, her uncle responded saying that 20 years was not a very long time for him. He was becoming very homesick. He wanted to see his friends, and his relatives, before they all grew old. Anyway, the trip home wasn't all that long. As for her parent's ages, he said he was closer to Connie's age than he was to the ages of her parents. He still had lots of time.

Connie wasn't sure what the uncle meant by his answer. I didn't know what her uncle meant by his answer either.

I didn't know what to make of some of her uncle's other statements as well. For example, the uncle was certain that when seen in outer space, the stars were all different colors.

Then there was another matter. The uncle had stated his home was very similar to southern Wisconsin. Did that mean that the soil and plants in his home area were similar to those in Southern Wisconsin? Connie seemed to think so. After all, the uncle did eat pretty much the same foods that we ate.

In the end, Connie and I just broke down laughing and shaking our heads. What an unusual uncle she had. We both agreed. Connie had certainly won our friendly little game of, "Who has the most unusual relatives?"

Connie closed by mentioning that she would bring her uncle by the local library to meet me. It would be on the coming Friday at noon. We could all have lunch together.

Friday came. I arrived out in front of the library 15 minutes or so before noon. Neither Connie nor her uncle were there. I waited until 20 minutes after noon. Still no one came. Since I knew the neighborhood and its restaurants, I pleasantly went looking for them. We were, after all, good friends.

After walking four or five blocks, I saw Connie and her uncle as they came walking around the corner of a building. They were off in the distance, perhaps two or three blocks away. I was standing on the sidewalk, up on the side of a hill. Connie and her uncle were laughing. They were very happy and having fun. Her uncle stood out clearly even from that distance.

He was not quite 6 feet tall, making him a little taller than Connie. He was well dressed, and obviously well-off financially. He was a somewhat athletic young man in his late 30's or early 40's. He appeared to be of Scandinavian descent, Norwegian, Swedish, Danish, or maybe Finnish. He appeared to be very polite, very intelligent, and generally speaking, a very pleasant person.

He otherwise appeared to be quite ordinary – and quite human. Because of the distance, I was unable to see his teeth.

Since Connie was having such a good time, I didn't want to interfere. I didn't want to spoil the party. I turned back towards the

library and went on my way.

Several years would pass. I was an enlisted man in the US Air Force. I was stationed at Binh Thuy, South Viet Nam. I walked over to the mail room. There was a letter from home. It was from my Mother. I read it with tears in my eyes. It was clear that my mother loved me.

The letter said that everything at home was fine. The weather had been good. Her house in London, Wisconsin, was in need of repairs.

Down near the end, my mother said she had been shopping in one of the local towns the other day. One of our mutual friends who knew Connie, came over to talk with my mother. Connie wanted me to know that her uncle had returned home.

Apparently, one recent nice summer weekend day, her aunt was sitting on the front porch of the house she had lived in all of her life. She was knitting. A new car pulled up and carefully parked in front of her house. Her uncle got out of the car. He had with him a single medium sized leather travel bag. He politely greeted her aunt as he walked slowly and nostalgically up to her front porch. He told her aunt that the ship he had come on was finally repaired. He had been here on Earth for 20 years and he was now able to go home.

He was very homesick. He was greatly looking forward to making the trip, and having fun with his old family and friends again. Evidently, one of his friends would be making the trip with him. He said that his friend was a young lady like himself.

He thanked Connie's aunt profusely for all of the help and friendship she and her family had given him over the years.

He said that since he would never again be able to come back to see the aunt, he was signing everything he owned over to her.

While her aunt sat more or less speechless, he proceeded to hand her the keys to his car. He signed the car's title and handed it to her as well. Then he politely handed her the pass books and check books to all of his bank accounts. The accounts contained a goodly amount of money.

He thanked Connie's aunt profusely some more. He was short of time and had to leave in order to meet up with his friend. He gently shook the aunt's hand good bye, promising he would never forget

her. Then he picked up his leather travel bag, turned, and politely left, walking down the street towards the train station, the way he had come so many years before.

The aunt, in tears, still speechless, stood on the porch and waved him "Good Bye

Other Exposure to NW24T

... Immediately after the tribulation of those days
shall the sun be darkened,
and the moon shall not give her light,
and the stars shall fall from heaven,
and the powers of the heavens shall be shaken.
... Matthew 24-29(NASV)

My grade school years were fun times. Many happy days were spent playing on our Wisconsin farm. My father had two work horses. He was very proud of both of them. Sometimes, especially during cold winter days, he would use them to take me to grade school. Unlike cars of those days, the horses always started nicely in cold winter weather. Not matter how bad the winter storm, the horses always knew the way to school, and the way back home.

We dressed warmly. The empty manure spreader which my father used, was quite safe. It was naturally cleaned by the frozen ice and snow, and I was, after all, a Wisconsin farm boy.

Many times, when winter storms closed the school for a day, we didn't get the message on the radio. Only one station carried the news. My father was so committed to my education that he would take me to school and drop me off anyway.

I would play quietly and wait patiently. If the teacher didn't show after an hour or two, I would pick up my books and happily play my way home. I did so even in the worst of winter snow storms, thick ice fogs, or in quiet, thickly falling snow. Soon, at a young age, I knew all of those winter roads just by the feeling of the gravel strips along their edges.

The entire experience taught me to value education very highly. It also taught me, at a young age, how to take care of myself, have fun, and to enjoy being alone. I also learned to pay attention to patterns and details.

Every intelligent Being who lives under Arctic conditions also learns to do the same.

Maple Corners school was a one room school house with one teacher for all eight grades. I remember playing on the swings, the teeter totters, the soft ball games, and our first field trip.

It wasn't all fun, however. I remember how proud I was the spring and summer when all four of my front teeth grew in. They came in pairs, each pair in turn. I got to enjoy all four of them for a little more than a month. Then school started in the fall.

On the first day of school an accident happened. I got hit in the mouth with a baseball.

My upper lip was badly cut, and blood spewed everywhere. The cutting edges of one of my new upper incisors were shattered. The cutting edges of both of my new lower incisors were broken. For many minutes, in intense and immediate pain and agony, I coughed up blood and pieces of my teeth. However, the three damaged teeth were still firmly fixed in my mouth. Their nerves and roots were not damaged or exposed. The bleeding stopped after a few minutes. Unnoticed at the time, I had not been otherwise harmed. I was still able to walk and to ride on a bike, and be taken home.

This was the last day of August. The school's student medical insurance policy did not start until the first day of September. We didn't have a school nurse. With the Labor Day holiday coming on, I would miss only the first two days of school.

Three weeks later, a dentist would smooth the rough edges on my three badly broken teeth. Then he would calmly explain to my parents that the teeth were now "Self Cleaning". The nerves inside each of them were still all undamaged and naturally protected. So, I should just be careful with them, especially during the many stretches of cold Wisconsin weather. I should plan on keeping them just the way they were. He said those three teeth could easily last me for the rest of my life.

The dentist wasn't all that wrong. I still carry all three of those teeth, along with their live nerves and intact roots. The third tooth, an upper incisor, is today carrying its second modern, high tech ceramic cap.

The two lower teeth look today, just the way they did as the red sun was setting that day on the playground at Maple Corners grade school, on the last day in August, so many years ago.

The fourth incisor's turn came too. The following winter, my parents and I were visiting the family home of some close friends. He was a young boy, two years old. It was late in the evening. I was sleeping face up on the floor. The boy was holding a drinking glass with a thick glass bottom. It was half full of water. He quietly toddled over to where I was sleeping, and dropped the glass directly on my mouth. The glass hit the bottom of my fourth incisor and broke off the entire lower cutting edge. Like the other three teeth, the nerve and the roots were not damaged.

Once again, I spent several minutes spitting out the broken pieces of the other upper incisor, and some blood, but had no other injuries. It was a clean break. There was no reason to take me to the dentist. I already knew the drill.

I still carry that same upper incisor with its live nerves and strong undamaged roots. It is still carrying its first modern, high tech ceramic cap.

I had to carry those four obviously broken teeth the rest of my growing up years. They were quite visible. I was very conscious of them. They made me look like something of a beast.

In later years, because of my broken teeth, I suppose, my conversations with other people seemed to turn to the subject of teeth and replacing or repairing them, more so than what one would normally expect. I was also more conscious of other people's perfect teeth as well.

The years passed. I learned to read and write. I practiced by reading all of the several thousand books and magazines stored in the pump house, and the other sheds on our farm. They were waiting to be sold to a traveling junk man, who never came. By the time I was finishing the fourth grade, I was reading at the level of a high school senior.

I found the now long lost and long forgotten old books and magazines to be quite interesting. They contained pictures of faraway places with strange sounding names. Those places included

mountains, fiords, and stretches of tundra in Norway, Sweden, and Finland.

Many of those same, now long lost and long forgotten old books and magazines in the pump house and other farm sheds, spoke of flying disks, flying saucers, and beings from other planets.

Some of the articles fancifully speculated that the surface of cloud covered Venus would look like southern Florida with beautifully tall women and dinosaurs. Other scientific articles spoke of supposed canals on Mars, and expected to find the remains of an ancient Martian civilization. So much for scientific accuracy.

A number of the articles had been published in the late 1940s. They talked of Roswell, New Mexico. They carried a number of eye witness accounts. Witnesses described broken complex bundles of coiled strands of metal coated thin ceramic fibers which they called "Angel Hair". "Angel Hair" had the ability to bend a beam of light from a flashlight around corners, if the fiber were bent into a broad arc. I am quite certain that a number of the accounts were correct.

At first, a number of UFO hunters considered the existence of Angel hair ceramic fibers to be proof that the Roswell wreckage was from actual extraterrestrial craft. Then, sometime later, a group of high-ranking physicists and other noted scientists began claiming that the existence of Angel hair metal coated ceramic fiber was proof that Roswell was a hoax. They claimed that Angel Hair, which is today called optical fiber, could never be made and could never exist. Surprisingly, a number of these disbelieving scientists appeared to also believe that beautiful tall women and dinosaurs might be found inhabiting the surface of the planet Venus.

A number of UFO hunters, possibly intimidated by the scientists' many credentials, I suppose, stopped referring to the huge quantities of Angel hair metal coated ceramic fiber which had been blasted all over the 1947 Roswell countryside by the various crashes. Perhaps they preferred to believe the word of noted, highly trained scientists, instead of carefully studying the melted, broken, coiled metal wire, and ceramic based ribbon cable type debris material which they were holding in their own hands.

I also do not remember anyone attempting to determine the temperature to which melted aluminum rich rocks and glass, and other such debris had been heated during the crash. They might have started at temperatures ranging from 2,000 degrees Fahrenheit to 2,200 degrees Fahrenheit.

Even today, Angel hair, i.e. complex bundles of heated, melted, and burned metal coated ceramic optical fiber, are seldom mentioned when the events of Roswell, 1947 are discussed. So many will ignore the Angel hair, then openly wonder how an extraterrestrial craft might generate force fields unknown to Albert Einstein, so that the craft might be lifted, propelled, steered, controlled, and shielded from the forces of inertia, acceleration, deceleration, radiation, and gravity.

In 1955, when we moved off the farm to London, Wisconsin, my family brought all of the old books and magazines with us. We stored them in the garage out back. I read and reread them all through grade school and into high school.

Time passed. The Space Race had begun. My high school years had also begun.

As an aside, when I was finishing high school, my parent's fortunes improved. They were able to purchase an ordinary, better house a few blocks away, also in London, Wisconsin. They moved out of the old shack which they had been forced to live in for those seemingly endless bad years.

The many old books and magazines were left behind in the old shack, and garage. Some other unknown person used to break into the old buildings at night, and read through the magazines. He seemed to be looking for something. He apparently smoked cigarettes. One night, while the intruder was there, a fire broke out in the old pantry. The resulting fire destroyed the old shack, the garage, and all of the old books and magazines.

The lawn outside which I had worked so hard to smooth, plant, and mow, is now the town park in London, Wisconsin. It is dedicated to America's military Veterans.

When I entered high school in the fall of 1958, my scores on the Wisconsin State Student Aptitude tests were extremely high. They

drew the attention of various high school principals, teachers and University professors.

One day a full professor in physics from a local University visited our high school. He came to give a few of the students an inspirational presentation and discuss research careers in the sciences. His trip was being paid for by the U.S. Government, so he obviously intended to have fun with the various topics.

When the discussion period arrived, the professor began by asking if any of the handful of students present knew how to design a Gravity Shield. None of us did. Then he said he wanted to discuss how a hypothetical gravity shield might work.

For example, if he placed one underneath a basketball, which way would the ball travel.

Some of the students thought the ball would respond by flying straight up out of sight. I responded by saying that the ball would travel in a straight line while the Earth's surface rotated away from underneath it. From the observer's point of view, the ball would appear to rise slowly away from the Earth's surface. Then it would appear to drift slowly towards the West while the spherical Earth continued to rotate towards the east. The Earth would continue on in its orbit, separating from the ball as it did so.

The professor was surprised. He apparently had not anticipated an answer such as mine. His own prepared analysis of the ball's hypothetical motion was significantly different.

Attempting to recover his poise, he switched to discussing how the Earth was both rotating and moving in space, as would the hypothetical ball.

Then he began happily laughing at himself. He was just starting to realize that navigation in space was far more difficult than he had previously thought. While he was laughing at himself, he went "Off Script". He related to us the following story.

On a cold wintery evening in December, sometime after the Russians had launched the first satellite, Sputnik I, a Highly respected high-ranking American U.S. AIR FORCE General came to visit the professor at his home. After sharing a warm evening meal, the professor and the General went for a pleasant walk around the

block. The General wanted to discuss advanced research possibilities in the sciences. The General asked how much money it would take to design and build a Gravity Shield.

The professor obviously believed the American General was an honest, highly dedicated, and intelligent individual who had repeatedly risked his personal life and his personal welfare in the service of his country. Quite properly, the professor treated the General with great respect.

The professor also expected that the students would find the General's question to be silly, humorous, entertaining, and an example of how the U.S. Government sometimes wastes money on laughable pursuits.

The General wondered if the Russians might possibly have developed a Gravity Shield. He wondered if the Russians had used such a device to help them launch the first Sputnik. The General would never say why he wondered, or what he may or may not have personally seen.

The professor solemnly reassured the General that building a Gravity Shield would be forever impossible, at any price. The General took pleasant issue with that conclusion. The discussion proceeded for another half hour. The General seemed to be certain that building Gravity Shields was absolutely possible. The professor stated that sometimes it seemed as if the General had actually seen a Gravity Shield himself. The General stated there might be more to the study of physics than the professor realized.

After a half hour of discussion had passed, the General was still convinced that building a Gravity Shield was possible. He told the professor that if the professor ever figured out a way to build such a device, he should immediately contact the General. Then the General went on to discuss other projects.

I was left wondering to myself. U.S. Air Force Generals have committed their entire lives to harsh military reality. Every one of them is trained to be extremely well disciplined and time conscious. I believed that no high-ranking U.S. Air Force General would spend 30 minutes of his precious time on any project unless he had previously seen at least a working pilot project.

I wondered: Maybe the General had seen bundled coils of Angel Hair metal coated ceramic fibers, too. Maybe the ones he had seen were built to carry exotic subatomic particles instead of light.

One day in high school, I was sitting quietly in the school library reading a book on astronomy. The librarian was a wonderful person. She was very intelligent and also very easy to talk with. Like me, she had a very strong Christian belief in God. She believed that God had answered her every prayer. Today, I believe she was correct.

She brought me a book which she thought I might like to read. She said that a young man in a business suit had brought it to the library some days earlier. He suggested that I might find it interesting, and fun to read. She said he was wearing an unusually narrow tie.

I thanked the librarian kindly, and checked out the book. I noted that the book was quite old. It was a U.S. Government publication which was in the public domain. Therefore, it was not subject to copyright. It was not a very big book. It had been long out of print, and it had a very obscure title. I was holding the only copy which I was ever able to locate. In later years, I was also unable to ever find any references to it anywhere.

I read it very slowly. It took me almost 3 weeks to complete. I read and reread the book several times. It was a medical study of the Nazi medical records from Auschwitz and the other Nazi death camps of World War II. A number of medical studies of the Nazi Death Camps had been performed by the U.S. Government and had been correspondingly published as public domain documents after the end of World War II.

I am depending entirely on my memory. According to the long lost, now forgotten book, a significant number of extra-terrestrials had died in the Nazi Death camps in World War II. One of the groups had been rounded up by the Nazis from the occupied countries around the Baltic Sea. This included Norway. As I remember, there were several thousand such individuals. According to the Nazi medical records, they appeared to be perfectly ordinary humans except they were genetically coded for only 24 teeth. Like some other humans, some of them had a slight webbing between their toes. The Nazis considered them to be defective humans, and refused to work with

them, or listen to their pleas. The Nazis sent all that they found to the death camps.

After I had read and reread the book for three weeks or so, the librarian pleasantly requested that I return it. She said the young man who had dropped it off, had stopped by and requested it back. He wanted only to make certain that I had seen and read the book. I thanked her kindly for showing me the interesting book. I immediately returned the book to her as requested. Two weeks later when I asked about the book, the librarian told me nicely that the young man had returned and taken the book with him. It would never return to the library. I would never see, or hear tell of the book again.

Time passed. One day in the late summer or early fall of 1962 arrived. I was a newly registered university freshman. I was in the student union. I had just arrived in an obscure section of the seating area for the cafeteria. The section was located in the basement, behind one of the large supporting pillars.

I was standing on the edge of a small group of what was, I assumed, other new University freshman. They had all quietly gathered together there, and just as quietly they were all having fun. We were introducing ourselves to each other. I was hoping to make some new friends, and enjoy some quiet time. Although it was a very quiet meeting, it was obvious they were all quite intelligent.

One of the young ladies was sitting in an unusually patient manner. She was sitting quite still. She seemed to like me. She sat looking straight at me for a while as the few other students chatted.

Speaking, at last, the young lady very calmly expressed surprise that my four damaged front teeth had not regrown. She thought there might be something that I should be doing, or some food that I should be eating to initiate the replacement process. She thought that if I had a dentist pull them out, they would all regrow.

I was caught off-guard. I didn't know how to answer. I was aghast at the thought of having my front teeth pulled out. I had been carrying them broken for many years. Defensively, I tried to explain these were my permanent teeth. If they were pulled out, they would never regrow.

The young lady didn't seem to understand. She argued pleasantly with me. The lady proceeded to relate how she had relatives on her mother's side. They had come over from the old country. Their teeth all regrew. She was adamant that one of her uncles had regrown all four of his lower molars when he was middle aged. She said that she, and all of her relatives were that way.

I still remember her sitting in the chair as she slowly became slightly more animated. She spoke perfect English. She was wearing a new dark multi-colored dress, of which she was quite proud. The dress had a somewhat unusual design. Because of her dress design, she would quickly stand out in any crowd. The blouse had a dark red panel on the front on her upper left side. She seemed to have come from a family that was well off. I realized that she, too, had to be quite intelligent.

I was shocked and embarrassed as she began gently chiding me for being so uniformed about teeth. Off balance, I stammered for words. I said that permanent teeth never regrow. She corrected me. She stated nicely that everybody's teeth regrew. She wondered why I didn't know that. She motioned with her right hand to a few of the other members of the very small group. She said, "Go ahead, ask them."

I was intimidated by her response. She was so certain. Some of the other members of the group openly agreed with her.

I felt humiliated and shaken. I gently excused myself from the group and left the student union. Over the next few days, back in my dormitory, in hesitant fashion, I asked a few of my other friends if lost permanent teeth ever regrew. Each one in turn assured me that lost permanent teeth never regrow. Once lost, they were lost forever. One of my friends openly wondered why I, of all people, would even bother to ask the question.

A few more days passed. I was walking through the Student Union. The same young lady walked up to me and nicely apologized. She said she hadn't known that my teeth would not regrow if I lost them. Then she quickly walked away into the crowd.

Time passed. One of my upper incisors started aching and showing signs of some decay. I made an appointment with a dentist.

The dentist was very highly trained and highly skilled.

The dentist did not work with any associates. He had a very small windowless one room office on the second floor of an old building. The building was located on the edge of a small country town in southern Wisconsin. The small town was a number of miles away and difficult to get to. A long straight indoor stairway led up from the street to his office. The stairway was poorly lit.

The dentist had almost no other patients at the time. He did not have a dental assistant, so during most of the sessions I had to hold some of the tools myself. He did all of the work.

He personally went down to a small dental lab in another nearby small country town, and personally made the final gold and ceramic crown. It was a new type of crown of his own design which he had never tried before. Getting it right took several tries. I had to sit through a number of sessions so he could complete the work.

I could only afford a little Novocain on one of the sessions. All of the rest of the work had to be done with the nerves still live in the tooth. I just had to brace myself and ignore the pain. All of the sessions were evening sessions. Sessions usually started at 6:00 p.m. in the evening. The entire job took almost three months.

We had to wait for my jaw to heal up between some of the sessions. When he put on the final crown and the work was completed, I was happy beyond words.

I remember one of the sessions. Darkness had already fallen, and a winter storm was moving in when I arrived at the street entrance to the dentist office. I entered the poorly lit stairway. Coming down the stairs from the dentist's office was an ordinary appearing nice young man, perhaps in his early thirties. We were both wearing heavy winter apparel so I couldn't see his face very well, and I doubt that he could see mine.

I waited at the bottom of the narrow stairway. Once he reached the bottom, we greeted each other nicely. He quickly passed by me. Then he headed out into the cold winter's night. He appeared to be of ordinary European descent.

I continued up the stairs to the dentist's office. I was noticeably apprehensive about my upcoming session, even though I was on

time. I was expecting on this session that the dentist would be spending more time drilling on my upper incisor. I might be the world's biggest chicken when I am in the dentist's chair, especially when Novocain is not being used.

When I entered the dentist's office, I found the dentist sitting in the comfortable patient's chair, shaking quite a bit.

After we greeted each other, he nervously asked me if I had seen the last patient on the stairway, as he left. I replied "Yes, I had," and he seemed like a nice enough person.

The dentist, still shaky, replied that the last patient had a broken tooth which he needed pulled. The patient said that he didn't need any Novocain to numb the nerves.

The dentist asked him if he was certain that he wouldn't need any Novocain. Pulling a tooth is a very painful process. The man replied by saying he was certain. The man said he had recently come here to Earth from a far-away planet, and his teeth were somewhat different from ours.

The dentist didn't believe him, and shrugged off the patient's statements. The dentist began by taking x-rays of his teeth. The x-rays were developed and mounted for viewing.

The dentist decided he would begin smoothing the broken tooth by drilling on it a little bit. Smoothing the tooth would make it easier to grab the tooth with the forceps. The dentist was expecting that the patient would feel a great deal of pain and change his mind about needing Novocain. While the Novocain was taking effect, the dentist would have time to view the x-rays for the first time.

Using the dental drill, the dentist began smoothing the broken tooth. The dentist worked a few minutes while the man sat with an open mouth.

When the smoothing was complete, the dentist took the forceps and began wiggling the tooth. To the surprise of the dentist, the broken molar came right out, roots and all. Through it all, the patient just sat there, obviously feeling very little if any pain. There was practically no blood lost or anything.

The man also had a back molar which had worn down a great deal. He wanted it pulled out too. The dentist immediately complied.

The man thanked the dentist kindly, and paid the bill. The dentist asked if the patient would need a bridge or a denture to replace the two lost teeth. The man just smiled, and said "No. Both teeth will grow back in a short time." Then the patient left happy.

The dentist pointed to the man's x-rays. While the dentist was calming down and getting over his shock, I reviewed the man's x-rays from a short distance. The x-rays showed only 24 teeth. All of them were baby teeth with very short roots. The x-rays also showed that a second set of baby teeth had formed in the man's jaws below the visible teeth. The second set of teeth also had short roots and could come in at any time, replacing the teeth above them.

The patient's molars looked normal enough for baby teeth, but each one was somewhat wider than corresponding human molars. The roots of his teeth were only half as long as the roots on ordinary adult human teeth. In addition, his teeth had far fewer nerves than ordinary human teeth do. So, according to the dentist, he never felt pain or toothaches as humans do.

The dentist was still shaky. I took my time reviewing the x-rays and talking calmly with the dentist. I wasn't in any hurry for a shaking dentist to begin drilling on any one of my teeth.

A few weeks later, on a different night, the dentist was still working on my front tooth. I was in some pain, and he was quite nervous. I accidentally jerked my head. The drill slipped, and the drill bit cut one of my nearby gums. Of course, I had no choice but to shrug it off and put some cotton on the wound.

While the dentist and I were waiting for the bleeding to stop, I asked him about the patient with the special teeth. The patient had told him that his life expectancy was 140 years. The dentist still seemed to become quite nervous when he remembered that previous evening. It appeared that he still needed to unburden himself, process his emotions, and calm down.

I was happy to talk with the dentist for a while. It was after all, one of my gums which his nervous hand had cut.

Once again, the dentist showed me the patient's x-rays. As expected, they still looked the same as before. Since the patient had only 24 teeth, and had appeared to possibly be of Norwegian

descent, I decided to refer to him as being The Norwegian with 24 teeth (NW24T).

When the gold ceramic crown was finally finished, I was very proud of it. The work was excellent. The final crown was excellent. In addition, the highly dedicated, highly trained dentist had performed all of the work for almost free. God had certainly been looking after both me and the dentist.

The crown was a little sensitive to very cold weather. In the wintertime when the temperature went down to thirty degrees below zero, I had to be very careful to keep it warm."

During the following weeks, I would see a young man whom I thought might have been the dentist's patient. I could never be certain because the nice young man appeared to have all of his teeth, and seemed to be a little shorter than I remembered. However, he was clearly an adult man, and he did have that same dental structure, namely a complete set of 24 baby teeth.

Also, I never mentioned or referred to my encounter, or to my experiences at the dentist's office when talking to anyone, the young man included. He, also, never mentioned it to me.

I would see him around from time to time, walking on various city streets. He was a surprisingly nice young man. We were on friendly terms. We would greet each other.

Once in a while, if we were close enough, we would exchange a few words. He spoke good English, although with a slight European accent. He had a calm and relaxed appearance. Usually he was very close mouthed. I was also very close mouthed. I never spoke of the medical study book which I had read in high school.

He liked to swim and quietly have fun, especially in cold, fresh lake water. One afternoon in the fall of that year, I saw him down by one of Wisconsin's lake shores. He had been swimming outdoors. The air temperature was perhaps 10 degrees Fahrenheit colder than what most humans would take. He was walking around in his shirt sleeves without a sweater or overcoat. He looked Norwegian enough. He was at home in the cold. He wasn't shivering or stomping his feet or anything.

Once, from some distance, I saw him walking with a young lady companion. I supposed he was showing her around. They were both walking naturally enough. They both appeared to be of Norwegian descent. Many people of Norwegian ancestry, and Scandinavian ancestry have always lived in the Southern Wisconsin area.

One cold snowy winter's day I went shopping in one of the area's small towns. I had to travel some distance to get there. It was just after 12 noon as I entered a drugstore with an adjoining restaurant. There were a large number of such stores in the small towns of southern Wisconsin in those days.

Standing inside in the warm store, was the nice young man. His young lady friend and her brother were standing with him. They appeared to be waiting for another friend to join them.

They did not stand out in any particular fashion. They appeared to be just three ordinary, very nice young adult people from some place far away, such as, perhaps, Norway. All three of them shared that same dental structure, namely a complete set of 24 baby teeth.

We were standing inside, out of the cold weather. We were in a very private area, just inside the second set of doors. On this cold winter day, the store was otherwise empty, and there were no other people anywhere within earshot.

Once inside, I stopped to take off my gloves and snow cap, and warm up. While I did so, my friend and I greeted each other in friendly fashion. He politely introduced me to his fiancé and her brother. He also introduced them to me. However, we only exchanged our first names. They had used only their first names, so to be polite, I used only my first name.

The brother nodded politely but did not speak. The young lady pleasantly responded in broken English with a northern European accent, and carefully asked me again for my name. As before, I responded with my first name, only.

My friend explained that his fiancé and her brother were still learning English. Both of them were able to read English. However, they had not yet learned to speak or understand spoken English. His fiancé understood a few simple words of the spoken English language, and was learning to speak a few words of it, herself.

However, her brother had not yet begun to learn to speak or understand spoken English. He explained that both his fiancé and her brother had arrived here only recently.

Whereupon, my friend's fiancé and her brother quietly retreated out of earshot, back into the store. Thus, my friend and I were left completely alone to carry on our private conversation.

I asked my friend if he meant they had come here from Norway.

He responded that Southern Norway was where their ship had landed. However, they had moved to Canada to be closer to where he and his family lived. His family lived in southern Ontario Province, Canada. They didn't live right in a city. Rather they lived out in a heavily forested section of the Province.

I asked my friend where the ship had come from originally. I asked about the journey, and about himself, his fiancé, and his friends. He was in an unusually talkative mood. He very quietly related to me the following story.

He didn't remember much about where he came from. He insisted that it was a planet orbiting a star which was close by. It was a dim red star that was almost not visible, or only sometimes visible, without a telescope. It was a star in the northern skies, much smaller than the sun. He never mentioned the star's name.

He said their sun wasn't very warm or very bright. He remembered his sun as being a bright red in color. He claimed that their sun appeared to be very small in their sky, even though their home planet was orbiting up close to it. However, lots of days they couldn't see their sun through the heavy clouds. He insisted that the way their sun looked at noon on his planet was similar to the way our sun looks at sundown on our planet.

He said their sun sometimes produced huge red flares. The flares themselves were extremely thin. The flare clouds were sort of like glowing patches of red-hot vacuums. The people on the planet would just stay underground for a few days until the flares passed

His description seemed to match Bernard's star, the fourth closest star, or perhaps the next star out in that direction. I could never be sure. Bernard's star and its one or two planets, lays alone out in deep space at approximately 5.75 light years distant. It appears to

be moving very quickly as it closes the distance between itself and our sun. In a few thousand years, it will pass by the sun, approaching somewhat closer than 4 light years.

He insisted that his home planet was almost the same exact size as the Earth. So, the force of gravity on his home planet was almost exactly the same as here on Earth. Unlike the Earth, his planet did not have a companion moon. Their planet did have a magnetic field strong enough to deflect most flares.

His planet's axis of rotation was not tilted. It was running upright in its orbit. It was also running in a nearly circular orbit. Consequently, there weren't any seasons on his home planet. He said that days on his home planet were almost the same as days on our planet.

His planet was a very cold planet. It had some oceans. It had storms. The planet was half iced over. The glaciers and the great ice sheets covered half of the distance from its poles to its equator.

My friend seemed to know a lot about glaciers, frozen lakes, arctic mountains, and fiords. He seemed to abhor jungles, deserts, and tropical islands. He said there weren't any jungles or deserts where he came from.

He said the climate at his planet's equator was very similar to the summertime climate of southern Norway, here on Earth. He said that many of the plants on his planet were the same as corresponding plants here on earth. I concluded that some of the animals on his planet must also be similar to some of the animals here on Earth.

He told how one of his sets of grandparents, his mother's parents, had made the long deep space journey here to Earth. They had come first. They left several years before he was born. His parents had just been newly married. The Grandparents had promised to prepare a place for all of them, a place where they could all be together. Their life expectancy is 140 Earth years, so both the parents and the Grandparents had plenty of time to prepare and to make the trip.

They were expecting that all of them would have a much better life here on Earth because it is a much warmer planet with a much brighter sun. They all wanted their children and grandchildren to grow up in a nicer, warmer place.

Several earth years passed on his home planet, while his grandparents completed their long journey to Earth.

My friend related that after he was born, his parents began making plans for all of them to come here to Earth. They wanted to join up with his mother's parents. They are very family oriented. They were permanently joined together by strong bonds of family love. His mother wanted very much to see her father again.

When my friend was four going on five Earth years old, he was finally old enough to travel. His parents packed him up along with survival packs containing some of their things. Together, they left their home behind. All three of them together, were laughing as they boarded the next deep space craft to Earth.

It took the craft twenty years to get here. My friend grew up during the voyage. A standard day/night routine was maintained on board the ship. I gathered that his ship was the lead ship of a fleet of two or perhaps three or four such ships traveling spread out in a group.

The common desire for the craft to be able to assist each other during the crucial landing attempt when arriving at Earth determined how much the individual craft were willing to spread out during the trip. Joining up both before the landing attempt and after landing on Earth was completed, was extremely important to them. Ideally, all of the NW24T craft wanted to land sequentially in turn, possible on the same day, or on sequential days. Consequentially, the individual ships were separated by, at most, only a few hours as they traveled.

My friend described how excited his mother was by the prospect of seeing her parents again. She was eager for the family to get back together as soon as they could, after they arrived here on Earth. She loved her parents and she especially wanted to see her father and talk with him. Apparently, during the voyage, they didn't hear anything from her parents.

According to my friend's description, the ship they were on accelerated continuously for 10 years. All of the propulsion engines were in the rear of the ship. The force of gravity on board was the same as the force of gravity here on Earth, and also on their home planet.

After 10 Earth years of acceleration, the midpoint of the journey was reached. My friend was now a teenager. The ship was traveling something like 58% the speed of light in free space. This was a velocity of something like 108,800 miles per second.

All of the occupants on board joined together for perhaps a month of careful preparation. Everything possible was tied down or lashed down, or otherwise secured. Then, on command, the crew totally shut down all of the engines.

When the engines shut down, everyone and everything that had not been tied down, floated around inside of the ship. The ship was darkened, and operating on emergency power. Only necessary lighting was on. Then the crew very carefully turned the large ship around, so the ship was now traveling with the propulsion engines in the front.

The crew carefully checked out the propulsion engines. The entire operation took two or three hours. Everyone on board knew that if the engines did not restart, they would all die in deep space. The other ships would not be able to help them.

While everyone on board prayed and held their breath, the crew then carefully restarted the engines. When the engines restarted, the main lighting came back on, the gravity returned and things stopped floating. Then everyone stopped holding their breath and began to party.

I said to my friend, "You mean like Mardi Gras?"

My friend, smiling, exclaimed, "No. Mardi Gras only lasts for one day. We partied for a month. For the first time, everyone knew we were going to make it. I mean, 'We partied.'"

We both spent a minute or two chuckling together. My friend was obviously remembering the fun times.

I asked what the force of gravity was like on board the ship, especially on startup after the engines turned back on?

He replied that the crew adjusted the force of gravity on board the craft to exactly match the force of gravity to be the same as here on Earth. He also insisted again, that gravity here on Earth was just the same as it is on their home planet because our two planets are the same size.

My friend further explained how the ship's engines were restarted. First the main engines were started, but the propulsion systems were not yet turned on. The electricity and the lights were turned back on. Then the gravity field was turned on.

After everything had stabilized, the propulsion systems were turned back on and started. The engines were now firing forward.

I thought for a few minutes. I interpreted my friend's description to mean that the craft was surrounded by an artificial gravity field, or perhaps something known as a gravity shield. The field had come back gradually, so nothing crashed when it fell.

Obviously, there had to be much more to the study of physics than Einstein had realized. For example, Einstein would never have been able to design engines for a deep space craft which could accelerate or decelerate the space craft continually for durations as long as 10 or 20 years.

My friend continued.

The ship continued traveling and decelerating for the next 10 Earth years with the engines in the front.

The next very difficult problem was the final major course correction. It came more than 9 Earth years later, when he was in his twenties. The maneuver had to be accomplished while the craft was still a long way out from Earth. The craft was further out than the orbit of the planet Jupiter. It was approaching the solar system from over the sun's north pole.

The craft was more than approximately 250 million miles from Earth, making the craft a very long way from Earth. The craft was traveling an estimated 825 miles per second. That is more than 4 million feet per second. The craft continued to slow down at the rate of 1.0 G. A force of 1.0 G is a change in velocity of only 32 ft per second (.006 miles/sec). For the incoming craft to deviate even the slightest bit from a straight-line path would easily generate inertial G forces of hundreds of times more than 40G. An unprotected craft attempting any such maneuvers could easily generate G forces so high that neither the craft itself, nor the people on board would survive.

The incoming NW24T craft must certainly have had a surrounding Gravity shield and a surrounding Inertia shield. The turning radius of the craft would have been limited by the ability of the on-board artificial gravity and the on-board inertial shield to compensate for the corresponding G forces which are generated during even the slightest of turns.

The craft's propulsion engines and gravity/inertial shields also had to compensate for the pull of the sun's gravitational field and for the sun's motion through the galaxy as the craft is slowing down. Thus, the craft's onboard artificial gravity/inertia shields had to maintain an onboard gravity field of approximately 1.0 G while the craft's propulsion and maneuvering engines were subjecting the entire craft to perhaps a minimum of 9 or 10 G, maybe even as much as 40. G.

The craft was approaching the solar system from a very difficult view point. Deciding exactly which planet is actually the Earth was a major problem. Mars has icecaps too. Then there are the planets Venus, Jupiter, Saturn, and Neptune which had to be considered.

The sun orbits the galaxy while the planets orbit the sun. The sun's path as it orbits the galactic center is not a flat curved line. The sun follows, rather, a huge wavy three-dimensional curved elliptical path as it orbits the galactic center. The combined result presents a very difficult navigational problem to incoming NW24T deep space craft. Each planet, along with the tilted rotating Earth and the Moon, is moving in its own giant wavy, three-dimensional helictical path.

Incoming Deep space craft, coming from Bernard's star and heading towards the Sun and its planets, are approaching the sun and its entire moving wavy helictical swarm of planets, comets, and asteroids, from a high forward angle. I.e. Our highly tilted solar system, and all of its many moving parts, is moving generally towards the incoming deep space craft.

In addition, both the Earth and the Moon bounce around a great deal in their orbits. The Earth and Moon are really two planets interfering with each other as together, they both move around the sun. They are both moving in paths which are very difficult to predict with precision.

The incoming NW24T pilots, while still out in deep space, must first locate the Earth, Moon, all of the planets, and the gravity related Lagrange points of equal balancing gravity fields. Then they must accurately predict with precision where the Earth and the planned landing site on Earth are going to be at landing time.

As if the navigational problem wasn't already difficult enough, the craft (an NW24T type craft) is approaching the tilted, rotating Earth from an angled viewpoint. The approach viewpoint is located generally above the iced over cloud covered Arctic ocean which covers the Earth's north pole. The incoming NW24T pilots may not be able to actually see a safe landing area. They may well have to begin the landing attempt hoping that one exists below the clouds which they are seeing in front of them, guided only by their landing radar.

Determining a proper aiming point for the landing calculations is significantly easier if the NW24T pilots and navigators, plan to land when the Earth is at or very near to one of the 4 very special points in the Earth's orbit.

These 4 points are the Spring Equinox (March 21), the Fall Equinox (September 23), the Winter Solstice (December 22), and the Summer Solstice (June 20,21). The final major midcourse correction is typically performed roughly 3 to 4 Earth weeks before the morning of the actual landing attempt. Therefore, the final major course correction is typically performed 3 to 4 weeks before the Earth arrives at either an Equinox point or a Solstice point.

The NW24T craft are not as high tech as one might think. The NW24T craft must come straight in and land on Earth, at any price. The craft are not capable of going into Earth orbit, shutting down, and then starting up and landing at a later time, the way the Tall White craft and the Roswell Grey craft are. Each NW24T craft gets only one chance to land safely or crash.

In addition, the NW24T craft must come more or less straight down through the Earth's atmosphere when landing. If an NW24T craft attempts to enter the Earth's atmosphere at an improper angle, the craft will skip, like a stone skipping on water. If such a craft skips, the now damaged out of control craft will fly back out into space. The

unfortunate occupants will have little chance, if any, of surviving the consequences.

Therefore, The NW24T pilots are not like the deep space pilots of the other extraterrestrial species, i.e. the Tall Whites, or The Greys. Those other extraterrestrial pilots prefer to trail the earth in its orbit and land at sundown on the night of the full moon. If anything goes wrong, those pilots can always back off, back out into space, while the moving Earth travels away from them, and try again later.

Instead, The NW24T pilots prefer to take their one chance by coming straight in to land on the northern front side of the moving Earth. Therefore, they generally prefer to make the landing attempt just after dawn here on Earth. They greatly prefer to have the Earth coming directly towards them during the landing attempt. No matter what happens, they greatly prefer to take their one chance in that manner. As previously stated, when they arrive here at Earth, the NW24T craft must land immediately at any price.

My friend continued. Like most of the NW24T craft, the craft he was on, made the landing attempt by aiming at a point over the ocean west of Norway.

I quietly noted to myself, there is a place out in the North Sea where the ocean is very shallow. It is approximately 60 miles out. It is called The Dogger Banks. It is very easy to find from space because it is in between some Scottish islands, and the coast of Norway. The location is far enough north so their craft can come straight in. The water there is shallow, so the pilot could be certain there weren't any obstacles below them at the landing site. In addition, if the Nw24T pilot were coming in too far to the west of the planned landing site, he could have quickly diverted to the coasts of Scotland or Ireland, among a selection of other sandy coastal places.

The pilot successfully stopped the craft just above the ocean. After the cheering onboard stopped, the pilots checked the condition of the craft. Then they moved the craft east to the coast of Norway and followed up one of the many large fiords to a hidden final landing site. My friend wouldn't otherwise say where the final landing site was actually located.

The entry and the final touchdown were fairly rough, but acceptable. Apparently, no unexpected G-forces were felt during the entry and landing process. At least, my friend did not mention any. So, I guessed that the on-board artificial gravity equipment was functioning properly. Quite honestly, I never thought to ask.

After 20 years in space, nobody was used to being on solid ground again. Apparently, their craft, like many other NW24T craft, had experienced some damage, and a substantial amount of wear and tear. It would need a great deal of refurbishment before it could be used again.

Another problem they faced was that there was no welcoming committee. The group was alone together on Earth for the first time. Nobody really knew quite what to do next. Everything was so unexpectedly strange, even the sight of weather, oceans, lakes, rivers, soil, and trees. For the children such as my friend, who had grown up during the trip, life on board the ship was the only life they had ever really known. The first few days, even though my friend was a perfectly able, intelligent grown man, and not in any danger, he depended heavily on his parents and the group's elders, for advice on what to do, what to eat, and on how to survive.

After a long while, apparently as long as several days, some of their friends here on Earth, were finally able to come out to meet them. Apparently, all of the other ships in the fleet had experienced very difficult landings, and the welcoming committee had to help them first.

My friend stated that after arrival, they stayed at a small reception facility which was hidden some distance out in the nearby forests. His mother still had not heard any family news or heard from her father. She kept asking to contact her father or her mother. She was quite intense. She had not heard from them for so many years. She wanted all of them to get together. Their people are a family people who love one another. They love each member of their family every day of their life.

After another week or so had passed, a group of their friends who were already here on Earth, came. They were all very quiet. They had his mother sit down. Then they carefully explained that her

father and her mother had both been put to death in one of the Nazi death camps, during World War II. There was nothing anyone could do.

The Nazis had put her parents to death, claiming that having twenty-four teeth made them less than perfect humans. I suppose the Nazis were checking everyone's dental records, or perhaps, some Nazi dentist had turned them in.

My friend told how his mother nearly went out of her mind with anger and rage for many days. Now she deeply hated all humans. All she wanted to do was meet their requirement of waiting 20 years here on Earth, and then return to their home planet. She considered all humans to be lower than animals.

My friend's mother probably wasn't all that wrong. After all, all humans and every mammal that has ever lived here on this Earth are genetically coded for only one set of baby teeth and one set of 32 permanent teeth – both men and horses alike.

Interestingly enough, when I skyped a conference in Norway a few years ago, several people in the audience reported they knew of others who were genetically coded for only 28 teeth, an anomaly that could only have occurred if sometime in past generations, NW24T had married humans.

Continuing

If you abide in me,
and my words abide in you,
you shall ask what you will,
and it shall be done unto you ...
... John 15:7(NASV)

I remember that winter afternoon in the drugstore. I was talking with my friend. I remember how my friend paused after relating his mother's rage.

After gently consoling him, I decided to change the subject. I asked him when his people first began coming here to this Earth.

He calmly proceeded.

He wasn't sure when they first started. He said they have been coming here in small groups for a very long time. However, he implied the number of their travelers to Earth increased noticeably back about the time of Charlemagne. That was roughly about the years 750 AD. to 800 AD.

The early years were very painful for them. Not every trip was successful because the navigation was very difficult. The landings were very difficult. There was little, if any support once they arrived. The culture here on Earth was barbaric and very primitive. In essence, every group was on their own. Many groups were never able to return home.

Even in the twentieth century, many of the ships that made it to Earth were off course and had very difficult landings. The west coasts of England or Alaska or Siberia were easily confused with the west coast of Norway. Also, in order to encounter the front of the Earth as it travels in space, the navigational computations remained very difficult.

My friend related that after World War II was over, his friends had contacted the American Government, and presented their "Wish List".

They requested a NATO style agreement with the US Government. Such an agreement would provide them with protection, so the dangers they faced from the German Nazis during World War II would never happen again. The agreement would also allow them to build a navigational beacon which could be used to guide the incoming Space Craft. It would also provide communications and landing information to the incoming craft.

He stated his people also requested the Americans build at least one NW24T base here on Earth for them. Such a base would make it much easier to recover, service and repair their deep space craft here on Earth. It would make it much easier for their people to come to Earth, stay a while, and return to their home planet if they chose. Such a base would allow our two planets to engage in interstellar commerce. Both planets would benefit.

The base would have nice facilities, hotels, shopping and entertainment areas. Maybe even a few casinos. New arrivals could stay there for a while and have fun while they were becoming acclimated to Earth. Dignitaries would also have nice buildings, entertainment centers, and conference facilities in which to meet.

While I listened, he continued on. He related that some years prior, perhaps back in 1949 or 1950, a small group of his people held a meeting with a famous American scientist who is now deceased. To protect the scientist's identity I shall refer to him only as "The Good Doctor", not his real name.

They were hoping to present and discuss their wish list with him. He related that "The Good Doctor" was very polite, but turned them down.

My friend wasn't sure that "The Good Doctor" believed them when they told him they had come from an Earth like planet orbiting a nearby star. They had to tell him of their origin so he would understand that they were making a reasonable request.

"The Good Doctor" said that the Earth's level of technology was not yet ready to be of any help. "The Good Doctor" noted at the time that none of the Earth's nations had yet fired even a single projectile to Earth's nearby moon. Building an operating moon base was one of America's highest priorities.

However, I understood my friend to say that “The Good Doctor” did believe the day would soon come when Americans were routinely traveling between the Earth and corresponding bases on the moon. When that day came, America would have sufficient technology and experience in space to respond to their request.

Just then, a new car pulled up outside in front of the drug store. It obviously carried the friends for which my friend, his fiancé, and her brother were waiting. My friend quickly broke off the conversation. My friend and his group quickly hurried out into the cold, to the waiting car. It was the last time I ever saw my friend or his fiancé and her brother.

In the coming weeks, on a handful of occasions I casually went looking for them. I quietly checked the old haunts. They were never there. On one occasion, I thought I saw the driver of the car walking a block or so away. However, as I slowly walked towards him, he kept his distance and hurried away. He had apparently recognized me.

For several years, I used to wonder about what I had heard. I decided that my friend’s account had to be true because he had no way of knowing about the medical study book which I had read in high school. The match between his grandparent’s deaths in the Nazi death camps and the book could not be a coincidence.

Of course, over the passing years, I also became convinced that the German Nazis in World War II had never received any technological help from any of the extraterrestrials because the Nazis were routinely putting significant numbers of the various types of extraterrestrials to death in the gas chambers.

I did some mental calculations. I reasoned that in order to make a trip of 5 or 6 light years or so, by the technique my friend described, the craft would only need to constantly accelerate for 10 years at 1.0 G, and then decelerate for 10 years at 1.0 G. The craft would reach a maximum velocity of approximately 58% the speed of light, and cover a distance roughly the same as the distance between our sun and Bernard’s star. I guessed that his home planet orbited Bernard’s star because it is the fourth closest star. It is the only star which fit my calculations, as well as fitting my friend’s general description.

Any other home star would probably require a longer travel time, or perhaps higher G forces and correspondingly better technology.

An acceleration of 1.0G results when the instantaneous velocity of the craft is increased by approximately 22 miles per hour every passing second. However, the average velocity of the craft during that second, increases by only one half that value. I.e. only roughly 11 miles per hour.

The propulsion engines have to do more than merely accelerate and decelerate the craft when they are out in deep space. The propulsion engines have to be able to control the craft and allow it to escape the gravitational pull of the Sun and its planets, as well the gravitational pull of the parent star. The craft must also escape the gravitational pull of any other nearby stars and their planets when landing or taking off.

In addition, the craft's engines have to compensate for the differing velocities of our sun and their parent star as both stars move around in our Milky Way galaxy. Then there's the matter of the force of gravity due to the entire Milky Way galaxy itself. Bernard's star is closer to the center of the Milky Way galaxy than is our Sun.

Therefore, to travel safely in deep space, the craft's accelerations and decelerations would probably have to be able to generate a minimum of something like 9 or 10 times the force of gravity here on Earth, whenever necessary. Obviously, our flexible bodies are very fragile, and have to be protected whenever unusual G forces are applied. After all, my friend did say that he grew up on board the spacecraft. His perfectly normal body did have to be protected continuously from high G forces for roughly 20 years.

I thought things over many times. There were many problem items to consider.

First came the simple military reality of the time. In order for anyone to propose a project to "The Good Doctor", they would have had to first discuss the project with various U.S. Air Force Generals. They would have had to first prove their identity to those Generals by showing them something not made on this Earth. Was it possible they had showed those Generals a Gravity Shield? Or perhaps a piece of used Angel Hair metal coated fiber optics? That technology

would have to be mastered before it would be possible to build or repair any deep space craft, no matter how its propulsion engines were designed. This is because every deep space craft would have to protect the craft and its occupants from the high G-Forces generated by even minor high-speed maneuvers. Space is so vast, unless a deep space craft was carrying its own internal high-speed inertia/gravity shields, it would not be able to safely travel much of anywhere.

They would be meeting with the same Generals who publicly insisted that all UFOs had ordinary explanations. Why wouldn't those Generals just ask the NW24T people to share some of their technology, such as a Gravity Shield, with "The Good Doctor"? Perhaps "The Good Doctor's" expertise did not match up very well with metal coated ceramic fiber optics technology. Perhaps they had visited the wrong laboratory and asked to talk with the wrong "Good Doctor".

Consider the matter of other matching technology. Making even small repairs on a carefully designed Deep Space Alien craft would encounter many technological problems. For example, are the electrical circuit boards interchangeable?

Then there was the matter of the craft's propulsion system. I decided the NW24T craft would have to be nuclear powered. To me, the initial 5 to 7 year waiting time sounded suspiciously like the nuclear decay half-life for radioactive Cobalt 60.

The most important item of technology on their wish list was the requested navigational beacon. One would be good. However, two would be better.

This would be especially true if the beacons took the form of two different large radar stations transmitting from two different locations, perhaps two places in Alaska. If their incoming spacecraft couldn't use the radar signals from the existing DEW line radars, what kind of signals were they asking for? And what about the signal travel times? Light itself takes at least something like 45 minutes to travel from the Earth, north out into space, to reach the NW24T final major course correction point.

I wondered: There was obviously more to the study of Physics and the physical sciences than Einstein had realized. Otherwise, my friend wouldn't have been standing there in the flesh, in front of me. Was it possible that there exists another kind of light, radar, radio waves, and subatomic particles which travel much faster than the speed of light in free space, and which interact only weakly with ordinary types of matter? I decided that answer had to be: Yes.

Einstein had to be wrong when he stated that nothing could travel faster than the speed of light, not even the force of gravity.

I decided that the force of gravity had to be traveling trillions of times faster than the speed of light. Otherwise, when my friend's deep space craft was making its crucial final course correction maneuvers, the forces of gravity would be directing the craft to a place in space that was at least 45 minutes of travel behind the Earth in its orbit. In 45 minutes, the earth travels at least 50,000 miles in its path around the sun. In 45 minutes, the incoming NW24T craft travels something like 600,000 miles.

The Earth's diameter is only approximately 7,900 miles. The final course correction maneuvers for the incoming NW24T craft have to be correct to within a few hundred miles or so. Therefore, when the NW24T pilots are making the final course correction maneuvers, they can not be firing blind. The NW24T pilots must know exactly where their moving craft is in relation to the moving Earth, moon, and sun, at firing time.

The NW24T pilots can only know these details with the precision which is required, if the force of gravity is naturally traveling trillions of times faster than the speed of light in free space.

Considering how both the Earth and the Moon bounce around in their orbits. If the force of gravity were traveling as slow as the speed of light in free space, the NW24T spacecraft would have very little, if any, chance of ever successfully completing the final course correction maneuvers.

Then there was the matter of the speed of light itself. If the NW24T pilots were being guided by the visual appearance of the Earth and its moon, when viewed from the final major course correction point, the images they would be seeing of the Earth and its moon would

also be at least 45 minutes (i.e. at least 50,000 miles) out of date. The pilots would be either aiming blindly at two irregularly moving targets, or at two empty places in space.

It's easy to see that a radio beacon or two on the Earth, transmitting using radio waves unknown to Einstein, waves that traveled many times faster than the speed of light in free space, would be an extremely valuable navigational aid. It would allow the NW24T pilots to know exactly where the Earth and its moon were at the same exact time that the maneuvering engines fired. After all, anytime the NW24T pilots fire the spacecraft's propulsion or maneuvering engines, their lives and the lives of everyone on board are on the line.

Then there was the matter of biology. Could my friends have actually been born on an Earth like planet orbiting a distant star, and still be almost exactly like us humans? They loved their parents as I loved mine. We both had to be "Of a Kind".

For my friends and I to be so much alike, there would have to be natural routine processes for The Earth to exchange biological and genetic material with other Earth like planets; sort of like plants sending out pollen and seeds – or viruses – or ancient hunters bringing plants and animals with them on their travels. Those natural processes would have to be able to operate across many light years of deep space. Perhaps meteor impact explosions would do the job.

I wondered: Was there more to the study of Biology and the life sciences and Earth's history than Darwin had realized?

God does work in mysterious ways.

So, it was with good reason, that meeting my NW24T friend caused me to question the conclusions of Albert Einstein and Charles Darwin, and strengthened my belief in a loving God.

The Sami

He that observeth the wind
shall not sow;
And He that regardeth the clouds
shall not reap ...
... Ecclesiastes 11:4(KJV)

There is a group of indigenous People who live in the Northern Scandinavian regions of Northern Europe and northwest Russia. Some of them identify themselves as The Sami (also spelled Saami). Some of the Sami identify the land in which they live as Sápmi. The word Sápmi translated into English means simply “The land of the Sami”.

The Sámi refer to themselves as “offspring of the Sons of the Sun” in their [Sámi national anthem](#).^[1]

There are ten or more Sami languages, depending on how a specific language is defined. The majority of the Sami, speak the language referred to as Northern Sami. Yet, many of the various groups of Sami are not able to understand the language of some of the other Sami groups.

None of the Sami languages may readily be said to have evolved from any other language here on this Earth. Apparently, where ever the Sami People originally came from, it was a place where a variety of different languages were spoken.

Here in modern times, the Sami People appear to be experiencing a major reawakening. For example, Finland now has a publicly elected body called Sámi Párlameanta (The “Sami Parliament.”). The Finnish Sámi Parliament is located in the Cultural Center building named “Sajos”. The “Sajos” is located in the Finnish village of Inari.

Surprisingly, the Sami have established a second cultural center. It is here in North America. It is currently located in the Lakeside building, 4915 East Superior Street, Suite 205, Duluth, Minnesota.

The tiny city of Duluth, Minnesota is located on the southwestern tip of the Great Lake named Superior. It is just across a small river from the tiny northern Wisconsin city of Superior, Wisconsin.

Both tiny cities are deeply embedded in the edge of the nearly endless, Great northern forest. The surrounding Great Northern Forest stretches north for several thousand miles before reaching, at last, the land of the arctic and the north polar icecap.

In addition to the two Sami cultural centers, the public museum in Milwaukee, in the southeastern corner of Wisconsin, has a collection relating to the Sami people. I found the Sami collection to be both interesting and informative. There may be other museum and art collections relating to the Sami, located around the world as well.

Over the passing years, the Sami People have appeared to me to be an unusually peaceful and friendly People with very ancient origins.

Sami culture and traditions, I have come to believe, include Reindeer herding, enjoyable fiestas, fun winter activities, beautifully colored clothing, extensive and beautiful silver and metal working, pleasant relaxing songs, and a number of interesting, unusual legends and ancient myths.

From what little I have seen, the Sami designs, fashions, silverwork, craftwork and artwork tend to be unique and unusually intricate. In my opinion, many of the Sami traditional designs, silverwork, metal work, craftwork, and artwork, were undoubtedly inspired and created by very intelligent Sami artisans.

As far as I have been able to determine, surprisingly, traditional Sami craft and fashions generally do not show any evidence of influence from the ancient Greeks. I find this to be especially surprising, since the ancient Greeks seem to have influenced most everything else in the ancient world.

The Sami national colors are red, blue, yellow, and green. Those colors figure prominently in the Sami flag and in their traditional clothing and designs. Those colors are sometimes referred to as "The Sami Colors".

The Sami flag was designed by artist Astrid Båhl. The Sami flag was adopted by the Nordic Sami Conference on August 16, 1986.

The conference has held as part of the Sami cultural awakening in Sápmi.

The Sami flag, of course, by its very nature, is intended to represent the Sami people. Naturally, the flag's design can be said to refer to Nature and to the natural world of the Sami, namely to Sápmi.

The Sami flag has a large red panel and a large blue panel. The flag also has a large circle, half red and half blue. The red half of the circle is said to represent the sun. The blue half of the circle is said to represent the moon. A vertical yellow stripe, and a vertical green stripe also appear in the Sami flag.

The flag is generally flown on the Sami National Day, which is February 6th, and on other important Sami holidays.

The Sami flag and their traditional clothing, might well look their most beautiful when viewed during the long twilight of a red arctic sunset over a large green forest, or on a bright blue moonlit arctic night, with the moon light reflecting off from a large span of blue or yellow glacial ice.

However, I am not a true artist. A true artist, I suppose, might possibly see things differently.

In the Sami flag, the color representing their sun is not necessarily considered to be the color yellow. Rather, as previously stated, in the Sami flag, the color which represents the sun may be considered to be the large Bright Red section. Likewise, the moon may be considered to be represented by the large bright blue section.

However, consider this:

Very cold glacial ice is very dense. Such ice has a deep blue or sometimes yellow color, no matter what color of sunlight falls upon it. The ice simply adsorbs all of the other colors.

Thus, a person like myself, could easily consider the yellow and blue colors in the Sami flag to represent large, very cold, very dense glacial ice fields.

In addition, plants which contain chlorophyll always contain green, even if the green is obscured by other more prominent colors, no matter where the plants might be growing. Green plants grow easily

in cold, fresh, drinkable, blue, glacial melt water. There is no salt in glacial melt water.

Thus, the flag of the Sami, with its various colors could be thought of as representing a beautiful area of forests and grasslands, next to a huge vast glacier, all under a red sun. Such a flag could easily and proudly represent Sampi, the land of the Sami. They live in the land of beautiful red sunsets, beautiful green plants, icy glaciers, cold, fresh, drinkable, blue, glacial melt water; illuminated by the light of the Midnight sun and of the midnight moon.

Therefore, the Sami flag could be thought of as an artistic representation of the Sami version of the Garden of Eden. Like all Earthly versions of the Garden of Eden, all of the various Sami versions of The Garden of Eden would not have to be located here on this Earth.

I remember my NW24T friend. He never said if the inhabitants of his home planet had a flag. I never thought to ask him. He did say that his home planet had a red sun, green plants, and big icy glaciers, presumably both yellow and blue. He also said that his home planet did not have a moon. If the NW24T did build a base here on Earth to repair their deep space ships, I wonder, what flag would they fly over it?

It is my belief that most of The Sami people live in Norway, Sweden, Finland, and in northwestern Russia. However, I believe that people of Sami descent may be found scattered all over the arctic regions of the northern hemisphere. These places include all of Scandinavia, Scotland, Ireland, England, southern Canada, and Southern Wisconsin.

It is my belief that Sami descendants may possibly be encountered in all walks of life. Sadly, many of the Sami descendants may possibly not remember their proud history, their various different languages, nor the culture, legends, and traditions of their ancestors.

Consider the following:

The forest covered village of Inari, where the Sami parliament and cultural centers are located, is possibly Finland's northernmost holiday resort and playground. It is positioned only a couple of degrees outside of the Arctic Circle. Considering its northern latitude,

the climate is surprisingly moderate. By comparison, Southern Wisconsin, where I grew up, typically gets colder in the winter and hotter in the summer than Inari. During the long cold Southern Wisconsin winters where I grew up, it is easy, I suppose, to become secretly envious of people living in other beautiful places with warmer climates.

The airport closest to Inari, Finland, I would guess, is located in the nearby village of Ivalo. A visitor, I suppose, would need only travel roughly 100 miles, heading straight north along level, open, nicely paved roads, to reach the Finnish border with Northern Norway.

Once inside Norway, the level, open, nicely paved roads appear to continue north for a number of miles, on to several nearby fiords, which come in off the Barents Sea.

All in all, the village of Inari seems to be a naturally beautiful place where world leaders, such as perhaps the American Presidents, or the Russian leaders, if they so choose, could easily come to relax, and perhaps visit privately with various Sami parliamentary delegates, and possibly discuss various topics among themselves.

One such possible topic, of course, might be the construction of additional resort facilities. Facilities such as hotels, restaurants, ski facilities, maybe a casino or two. Perhaps a cruise ship base, and other cargo, repair, navy and merchant shipping facilities, could also be constructed on one or more of the fiords coming in off the Barents Sea. The amount of available level open space to work with, appears to me, to be shockingly huge.

The Barents Sea seems to me to be quite shallow. Back during the time of the last ice age, the ocean levels were much lower. At that time, much of what is now The Barents Sea might well have been forests, grasslands, and open tundra.

In order to expand the resort facilities, it would, I suppose, also be necessary to expand the airport, build a sea port, and perhaps build some spaceport facilities. After all, the laws of physics, as applied to space flight and deep space flight, tell us there are many natural advantages to having deep space launch facilities located in both the Arctic and the Antarctic regions of the Earth.

For example, Bernard's star, the fourth closest star, is a northern hemisphere star. Its starlight falls straight down on the Arctic ice, touching the northern coast of Norway, as well as the buildings of Inari, Finland.

Bernard's star is a small dim, barely visible, red star. At night, its dim red, almost unseen starlight also falls straight down on the rest of the land of the Sami, possibly enhancing the beautiful red and blue traditional clothes which, I suppose, they frequently wear during their winter evening festivals.

Of course, the major support, supply, and repair facilities would probably be more effective if they were located in the warmer climates which are further south around the Baltic sea. I understand that working with metals, ceramics, and the ribbon cable version of metal coated fiber optic cables can be quite difficult in weather that is very cold.

Of course, in this day and age, given the high importance of the United States activities in space, every such support, supply, landing, quarantine, and launch facility would need to be securely protected. Such protection, I would guess, might well be provided by a group of appropriately located NATO or American military bases.

Quite probably, perhaps hundreds or even thousands of years ago, NW24T space pilots approaching the Earth from over the arctic regions around the north pole, may have noted that the dim red light from Bernard's star falls directly down on both sides of the Bering strait, and the Aleutian Islands off Alaska, as well as falling down on the Ocean west of Norway. I would guess that the Aleutian islands which figured prominently in World War II, would have naturally come to mind.

Until very recently, the Ocean west of Norway, I would guess, would probably have been their preferred landing point because it would appear to me to be the safest place to attempt a blind unsupported landing. Once on the ground, the NW24T travelers would possibly have been able to link up with previous friendly NW24T travelers who had traveled to Earth before them.

However, that was Then. This is Now. In today's world, the NW24T pilots, before beginning a landing attempt, would probably find

beacons, landing aids, rescue equipment, welcoming facilities, waiting supplies, and a quarantine station located alone on an island, on stand-by, to be quite helpful. After completing quarantine and welcoming committee activities, the NW24T travelers would probably seek to link up with previous friendly NW24T travelers. I suppose modern communications would make it all quite easy.

This is especially true if the NW24T space travelers were, perhaps, supported by a welcoming formation of large radar reflecting aircraft carrying relief supplies, and showing insignias of the proper friendly colors.

Remember that during the actual landing attempt, onboard the incoming NW24T craft, there might not be anyone who speaks, understands, or reads any of the Earth based languages such as English, Norwegian, Swedish, Finnish, or Russian. Remember too, the incoming NW24T space craft might be coming in too-fast, damaged, worn-out, and/or off course. After all, I believe, they would have been traveling in space for approximately 20 years. I also believe the NW24T spacecraft do have to come in immediately, at any price. I believe that incoming NW24T spacecraft can never be waved off.

Formations of such supporting aircraft could, possibly, fly in straight lines, forming approach vectors which would show up on the onboard radar screens of the incoming NW24T deep space craft.

In the event of an actual non-standard landing, the same aircraft could possibly be able to arrive quickly at the scene with relief supplies, and maybe provide immediate support if needed.

Of course, nowadays, there probably isn't really enough open space for formations of such aircraft to form up, or to maintain the formation or maintain the pointing vector for a long duration of time, if the NW24T pilots were planning on using a landing site which was over the ocean west of Norway.

So, possibly, any ground aircraft supporting the planned landing attempt, might well redirect the incoming NW24T pilots to change the planned landing site to some other place in the northern arctic regions. Several possible places come to mind. One such possible place might be the Bearing Strait west of Alaska.

By watching the public national news sources on the publicly available Television stations here in the United States, and reading the publicly available newspapers here in the United States, I see that formations of airplanes, both American and Russian, from time to time, fly training missions in the area of the Bering Straits. On all such missions, of course, the airplanes carry beautiful, colorful markings as they fly in straight, tight, parade-like formations.

I served as an enlisted man in the US Air Force. I proudly served as a weather observer in both the deserts of Nevada and in the jungles of South Vietnam during the mid 1960s. I have watched with tears of pride in my eyes, many formations of American USAF aircraft. When I first noticed pictures of the training formations over the Bering straits which were being shown on the various public news casts, I was very favorably impressed. They were being performed a number of days before the solstices and equinoxes, as well as a number of days after. To me, it brought back so many pleasant memories of my years of proud service in the U.S. Air Force.

However, somehow, I wasn't surprised.

NW24T Nuclear Batteries

“And the LORD God planted a garden eastward in Eden;
and there he put the man whom he had formed.”
... Genesis 2:8(NASV)

The first few small groups of NW24T may well have began arriving here on this Earth several thousand years ago. It would have been more difficult for them to make the deep space crossing back then. The sun and the stars in the sky have always been in continual motion, caused in large part by the constant rotation and movements of our own Milky Way Galaxy. The distances between our sun and the nearby stars have always been constantly changing. Our sun and Bernard's star, for example, are somewhat different distances from our galaxy's center of rotation.

During the last Ice age, for example, Bernard's star was perhaps twice as far away as it is today. Back then Bernard's star was something like 10 light years away, compared to 5.75 light years today. Back then, it could easily have taken the NW24T something like 35 years to travel to Earth, compared to 20 years today. Back then, I suppose, the NW24T craft, would have had to accelerate to speeds approaching the speed of light in free space, and do so at a constant acceleration of 1.0 G.

The other extraterrestrials which I have personally observed in my younger years (i.e. The Tall Whites and the Roswell Greys), both have a much higher level of technology, than do the NW24T. The Tall White deep space craft and the Roswell Grey deep space craft are easily capable of accelerating to speeds many times the speed of light in deep space.

For example, back in the summer of 1965, when I was an enlisted weather observer in the USAF on TDY out in the desert on the Indian Springs, Nevada Gunnery Ranges, I once estimated that a particular large black Tall White deep space craft was capable of cruising out in deep interstellar space at speeds at least as great as

44 times the speed of light in free space, and able to accelerate and perform maneuvers at more than 15,000 G. It generated surrounding force fields which totally protected the craft and its on-board occupants from the effects of space, radiation, and inertial G-forces caused by acceleration. Without question, at all times, that same craft provided its occupants with continuous onboard artificial gravity which could be adjusted to any desired level, such as 1.0 G while eliminating all onboard inertial G forces.

Thus, I also estimated that particular Tall White deep space, if the Tall White pilots so desired, was capable of covering a distance of 5.75 light years in less than 2 months. I am quite certain there is a lot more to the science of Physics than Einstein was aware of.

However, it is my belief that the NW24T possess only a much lower level of technology than do The Tall Whites and The Roswell Greys. I believe the NW24T corresponding deep space craft design, does not permit the NW24T craft to exceed the speed of light in free space. Thus, I believe, the maximum distance which the NW24T craft are able to travel in deep space is limited to approximately 10 Light Years. This means that I believe the earliest the ancient NW24T People would have been able to travel here to Earth, is approximately 10,000 b.c.e.

Even so, it is entirely possible that back then, even with the longer travel times, and the required higher maximum speeds, the NW24T technology would still have been up to the task.

For example, the power sources for the NW24T deep space craft might very well have always been a type of long duration Nuclear battery known as a Radioisotope Thermoelectric Generator (RTG). Such nuclear batteries are designed around various suitable Radioactive isotopes with long half-lives. The batteries are sealed. They have no moving parts, and generally require no maintenance. They would be a natural choice to provide long term electrical power for NW24T deep space craft. A significant number of different radioactive isotopes could be used as the power sources. Possibilities may include Curium 243 with a half-life of 29.3 years. It decays using both alpha and beta rays. Quite a few other radioactive isotopes might possibly be used as well. Some have long half-lives.

For example, Plutonium 238 has a half-life of 87.7 years and has very low shielding requirements. Such nuclear batteries, of course, generate heat, and may easily run hot. Depending on the design, from time to time they may also generate thermal induced soft clicking or soft tapping sounds.

Building an RTG can be quite expensive. To use a RTG nuclear battery safely on a manned deep space craft, the radioactive isotopes must be contained in a sealed container. An appropriate sealed container may very easily appear to be a pot of gold and silver alloy, constructed out of, say 22k gold. Here on Earth, 22k gold is jewelry and money grade gold.

A suitable container would not need to be any larger than a standard sized cooking pot known as a crock pot. Even so, gold and silver are Heavy Metals. Such RTG containers would be quite heavy.

NW24T operators would probably need to wear protective clothing, such as leather aprons for heat protection and radiation protection of their vital parts. Also, they would probably need to wear silver metal protectors on their shoes for both physical protection of their feet and toes, as well as radiation protection.

The gold and silver metals which comprise the pot of gold perform several different functions. For example, they function as radiation shielding and also as neutron reflectors. The pot of gold would protect both ways. It would protect the Nuclear RTG battery from outside stray neutrons and other stray radiation, while the craft traveled in deep space. It would also protect the passengers on board the craft by shielding them from all types of radiation generated by the RTG nuclear batteries themselves.

The electrical wires (or optical fibers) coming out of such a RTG Nuclear Electrical Generator, of necessity, would be color coded, for the same reasons that all electrical wiring is color coded. Thus, to an uninformed ancient earthling, such a device could easily appear to be a very valuable pot of gold located at the end of a Rainbow.

Of course, for reasons of security and simple radiation safety, once the NW24T craft have landed, the entire RTG apparatus would need to be removed from the craft, and buried in the ground in a remote secluded area. Such remote secluded areas exist in many places.

These places include large remote areas of northern Scotland, and also places in Ireland, as well as Scandinavia.

As such, the buried RTG would now be properly and safely shielded, while it was still capable of producing electrical power, heating, and lighting for the NW24T personnel who were maintaining and repairing the deep space craft, hoping one day, to be able to return home.

There is good reason to believe, then, that legends of Leprechauns with magical skills, wearing Red, then later Green specialized clothing, hiding out in the remote and distant areas of Scotland and Ireland, wearing special (i.e. protective) clothing, hats, beards, and shoes with special protective silver buckles, frequently carrying special tools (i.e. smoking pipes with very long stems so hot/cold radioactive controls do not need to be touched?, special silver shoe buckles which may double as TRG container handles, and foot protection, etc.), protecting a valuable pot of gold buried in the ground at the end of a rainbow, may very well have a basis in reality.

Perhaps, modern UFO hunters might consider searching the distant remote wilderness sections of Scotland, and Ireland, with metal detectors and radiation detectors, accompanied by experts in analyzing ancient pieces of money and jewelry. Spent sealed RTG nuclear batteries do not have to be very large. Also, pots and pieces of 22k gold are easily confused with ancient pieces of money, valuables, or jewelry.

If the NW24T craft arrived in pairs, then by using one of the two craft for replacement parts, and moving all of the RTG power sources from both craft onto the craft in the best repair, then the NW24T would be able to return with some of their personnel, as soon as any stray radiation had decayed away. Spent RTG nuclear batteries would be left behind in distant remote places, buried in the ground for safety.

The stray radiation produced would, without a doubt, include Cobalt 60 with a half-life of 5.2 years. The reasons are very simple. Whenever the NW24T began traveling from their home planet to this Earth, they would have had to design their deep space craft to use

common earthly metals such iron, copper, tin, zinc, silver, and gold whenever possible. Iron and its alloys may be easily welded and otherwise worked with. The various steel alloys are needed for long term structural strength.

Such a design philosophy would have given the NW24T the best chance of repairing their deep space craft and using it to return to their home planet if they wanted to. In addition, such metals are commonly found all over this Earth.

In addition, very high energy cosmic rays and high energy neutrons are found throughout deep space. The nuclei of the common metals such as iron, nickel, and cobalt, easily absorb stray neutrons into the nucleus, eventually generating Cobalt-60. Over the course of a 20 year trip in deep space, this process may easily generate a significant amount of radioactive Cobalt 60 within the structural components of the NW24T craft.

Thus, after the NW24T deep space craft has landed successfully, the NW24T Crew may very well wish to wait for at least one Cobalt -60 half-life of 5.2 years, to allow half of the radioactive Cobalt -60 atoms to decay to stable isotopes, before beginning to work on the various radioactive components.

After all, Connie's uncle did say that he had to stay here on this Earth for at least 5 to 7 years (one CO-60 half-life) before he would even know if returning to his home planet was possible. Then, even though it was possible, he had to wait for 20 years (4 Co-60 half-lives – i.e. until only 1/16 of the CO-60 radiation remained) before his deep space craft could actually be used.

Of course, in ancient times, once the NW24T arrived here on Earth, the RTG sealed power sources would have been extremely valuable, even if the power output levels had decayed to levels too low to be of use on another NW24T craft. The NW24T personnel would naturally have selected a tiny few older personnel, who may have already been too old to easily travel, to remain with the buried RTG nuclear batteries, to protect and maintain them for the good of the other NW24T personnel.

Due to the dangers of radiation exposure, and the obvious need to be highly trained, such personnel would naturally have been short

older men.

Remember, while the NW24T craft are traveling out in deep space between the stars, being a short older man has a number of very important natural advantages. Both weight and physical space onboard such a craft are at a high premium.

Remember, also, the US Air Force has height and weight limits for its astronauts.

The NW24T would naturally design their craft so that the RTG sealed nuclear batteries would be located in small, symmetrically placed, carefully balanced, highly strengthened, tightly secured, compartments at the rear of the craft, and close to the propulsion engines. The touch controls would naturally be behind open cage-like protectors, necessitating the use of long-stemmed smoking pipe like insulated tools, in order to operate the various electrical controls in a weightless environment. The RTG batteries and the propulsion engines must survive accidents, high G forces, and landing/launch stresses, more than any other section of the craft. Short older men, with naturally small hands, have a significant advantage under those conditions. They also have a significant advantage operating under the weightless conditions which the craft's engineers encounter during the midcourse correction, when the engines are turned off, the craft is turned around, and the engines are restarted.

Of course, older men, who have already have raised a family, would still need to be wearing protective clothing, radiation shielding, and silver metal shoe and feet protectors (perhaps shaped like buckles) on their feet. As previously stated, the RTG nuclear batteries would be both hot, dangerous, and heavy.

Once the NW24T craft have landed, and the craft's power sources shut down, all of the women, young adults, and children, would be in immediate need of earthly food, drinking water, and supplies. They would naturally form up into travelling groups. Those groups would naturally have set out for greener pastures very soon after landing. They would have needed to settle into their new lives here on Earth, and perhaps blend in with the humans here on Earth in order to survive.

The few older men, wearing distinctive clothing, would have been left behind to tend the buried RTG nuclear batteries, to heal any possible radiation burns, to tend to the needs of the landed spacecraft, and to otherwise fend for themselves.

For comparison, to the best of my knowledge, virtually all legends of Leprechauns and “The Little People” agree that there are no women Leprechauns. All Leprechauns that I have ever heard of, are short older men. Remember the rules of biology are iron clad, and cannot be idly violated. Any real Leprechauns, as a group, must have mothers, wives, sons, and daughters. If Leprechauns are real, then those other Leprechauns must be hiding in plain sight among other humans here on Earth.

Also, to the best of my knowledge, virtually all legends relating to Leprechauns agree, Leprechauns live much longer than do ordinary humans. One wonders, why Leprechaun legends, which possibly started among the Celts during the 7th century A.D., are only found in areas of this Earth which correspond to the possible NW24T landing grounds in bygone times.

Over the course of the many years the NW24T have been coming to this Earth, their pilots have faced many different difficult landing scenarios here on Earth. One would expect that there were a significant number of failed or diverted landing attempts. So, one might expect that a number of small groups of NW24T survivors would have been scattered across broad sections of the Earth’s northern regions. It is entirely possible that the descendants of these scattered groups, along with their myths and legends, would have existed and survived here on Earth down to modern times.

Of course, many, or even perhaps all of the descendants would have soon forgotten their ancestry, their myths, their legends, and their history. Within a few generations, their descendants would have formed either close tightly knit clans, or perhaps blended into the surrounding human populations. However, some NW24T genetic traits would still persist within at least a handful of individuals, or within specific clans. One might expect some of these genetic traits

to include the dental structure, the longevity, and the naturally peaceful disposition of their forebearers.

In ancient times, the incoming NW24T craft would have been aiming for a safe landing over the ocean west of, and nearby to the coast of Norway. There are many reasons why an NW24T pilot might reasonably have chosen at the last minute, to divert away from the planned aiming point of the Dogger Banks, and instead, continue along nearly the same flight path, to land in either Scotland or Ireland. One simple reason is that from space, to the newcomer's eye, the coasts of Scotland and the southwestern section of Ireland are easily confused with the southwestern section of Norway.

Consider, for example, the island of Ireland with its many ancient tightly knit clans. One such ancient district in Southwestern Ireland is named Desmond.

Consider the legends relating to The Old Countess of Desmond, Katherine Fitzgerald. She lived in Ireland during the late 1500's. She was a member of the Fitzgerald clan. According to legend, during her lifetime, she regrew a complete set of teeth when she was 70 years old. Legend also has it that she lived to be 140 years old. Apparently, she died at a very old age by falling out of a cherry tree or perhaps a nut tree, which she had climbed in order to pick the fruit.

Admittedly, ancient and historical accounts may contain many errors, exaggerations, and omissions. However, historical accounts may easily contain elements of truth. Even today, there are a number of Irish whose records indicate they have lived more than 110 years, perhaps even 120 years.

In the case of The Countess of Desmond, there seems to be good reasons for believing she lived to be more than 100 years old. There also seems to be generally good reasons to believe she fell out of a cherry tree or a nut tree at a very advanced age.

Given the state of the medicine and the science of Dentistry in the late 1500s, the mere suggestion that an ordinary human more than 100 years old, would climb a tree so they could eat nuts or raw cherries would raise a lot of eyebrows. Yet, those people who

personally knew the Old Countess, as far as I know, never questioned those accounts.

Of course, a person who is more than 100 years old, needs to have a very good set of teeth to eat nuts or raw cherries. Those foods must be carefully chewed before swallowing. Although she was impoverished, the Old Countess appears to have been reasonably well fed. This suggests that even in her old age, she had a good, or new set of teeth.

The known portraits of her do not show her teeth, per se. However, the portraits show an old woman of advanced years with unusually firm jaws and gums. Thus, the known portraits of her strongly suggest that she is carrying a complete set of good or new teeth. If The old Countess of Desmond could regrow a new set of teeth when she was 70 years old, then presumably she could regrow as many sets of teeth as she needed. My NW24T friend could. My NW24T friend did, after all, claim a life expectancy of 140 years, which is the same as the legendary age of the Old Countess.

According to historians, the Old Countess had a daughter who was an invalid. One wonders about the daughter's dental history. A study of the ancestral history and genetic history of the various Irish clans in the same area of Southwestern Ireland would also be quite interesting. It is hoped that such a history would include topics relating to dentistry, food preferences, and longevity.

All things considered, we are justified in asking:

Is it possible that the old Countess was an adopted child?

If so, one wonders how many other children may have been adopted by the Fitzgerald clan, or the surrounding clans.

To begin with, an individual may be a member of an Irish clan or a Scottish clan without having any biological relationship with any other clan member. A clan was simply a group of people who identified with each other and who wished to stay in lifelong contact as they lived their lives together.

In Scotland and Ireland, clans had an official legal structure, a coat of arms, a sense of shared identity, and so forth. Therefore, the names, locations, and histories of clan members was recorded and

tracked by official governmental record keepers. I.e. One clan member could always locate another clan member.

For example, a group of, say, a dozen or so abandoned NW24T children who formed a childhood playgroup, who shared close childhood friendships, who identified with each other's problems, who were individually adopted by separate families, might very reasonably form a clan, or join an existing clan. Clan records and Governmental records would allow the children to stay in contact with each other for the rest of their lives.

In addition, Clan records and Governmental records would also allow the NW24T parents, who had placed their children for adoption, to relocate each of their children at any time in their lives. Remember, the NW24T are highly intelligent, and, just by being here on this planet, they have proven their ability to make highly detailed, highly intelligent, long range plans.

Consider the following:

A significant number of years ago, I had a casual acquaintance who was a very pleasant lady, whom I shall call my distant friend. I do not remember her real name and I wish to protect her identity.

I first noticed my distant friend because she was so calm and relaxed. She immediately reminded me of the calm and relaxed young lady whom I had seen so many years ago in the student union, i.e. the young lady who had been unaware that I could not regrow any of my permanent teeth.

My distant friend would just sit naturally, pleasantly, calmly and quietly in the same position among the other ladies, sometimes for as long as 30 minutes, without making any stray hand motions, or showing any extraneous movements.

I had something of a quandary. I had come to associate such pleasant calmness with the NW24T People. Yet, I was absolutely certain that she had been born here on this Earth. She had grown up here on this Earth. She was highly educated. She had attended schools here on this Earth. She was highly intelligent. There was absolutely no question that both she and I were equal in the eyes of God. Quite simply, we are both God's children.

Still, I had the problem, none of the other ladies could naturally sit so calmly, not crossing or uncrossing their legs for so long.

One day, in a long, otherwise empty hallway, I was quietly talking to one of my ex-military friends. My distant friend, alone, came pleasantly walking down the hallway. I was talking to my ex-military friend about my NW24T friend and his mother's experiences. My distant friend stopped some distance away, and quietly listened for a short while. After a few minutes, my conversation ended and we all continued on our individual ways. I did not think anything of it at the time.

On the day, years ago, when I last saw my distant friend, I was walking down that same long empty hallway. My distant friend was walking towards me. She pleasantly stopped me. The two of us were totally alone in the hallway for a few minutes.

My distant friend said she especially appreciated hearing about the Norwegians With 24 Teeth. She said when she was a small child, her parents, along with a small group of similar parents with small children, had gotten together. They had formed the children into a playgroup. The children played together. They went to school together. They did practically everything together, every day.

Then one day, after a few years had passed, all of the parents in the group got together and placed each of the children for adoption. Each of the families who choose to adopt the various children had to agree to keep all of the children together in the playgroup. The children had to attend the same schools. The children had to be allowed to play with each other. The children could never be separated.

The parents said they were very homesick, and they were all going to some place very far away. They did not believe they could ever return. To the dismay of the children, there came a last day. It was the last time any of the children ever saw any of their parents again.

In effect, the parents had formed a clan, and placed the children up for adoption within the clan.

My distant friend said for many years she and the other children were very angry with their parents for abandoning them. None of the children understood why their parents had put them up for adoption,

or where their parents had gone to. All of the children had grown up feeling unloved.

My distant friend stated when she and the other children in her playgroup had heard of my experiences with the Norwegians With 24 Teeth, suddenly they all understood what had happened.

All of the children understood that their parents were homesick for their home planet. However, none of the children would ever be able to adjust to living on their parent's home planet, with its cold red sun and many permanent glaciers.

Suddenly, all the children understood their parents had loved each one of them immensely. Their parents wanted each child to have a better life, on a warmer planet than the home planet on which their parents had lived.

So, their parents had formed a clan here on Earth to raise and to take care of the children in a loving manner, and to keep the children all together, so their parents and their blood relatives could always find them again, as the years went by.

Then, my distant friend informed me that she and each member of her playgroup, had only 24 teeth which naturally replaced themselves.

My distant friend thanked me kindly. Then she quietly walked away.

So, it is with good reason, that I wonder if The Old Countess was adopted.

The Old Countess is said to have been an only child. However, the actual details of her birth place and birth date appear to me to be fairly sketchy. Her birthplace was said to be near Waterford, on the reasonably flat and open Irish coastal grasslands in South Eastern Ireland. The entire area is easily visible from space. Anything that flies and needs to land immediately might well choose to land there.

At first glance, The Old Countess appears to have lived generally twice as long, more or less, than any other member of the clan. That includes her Earthly father and all of her husbands. This is consistent with the NW24T life expectancy.

Her dental structure appears to match the NW24T dental structure. Her personality was sometimes said to have been rude towards

other humans. This is consistent with the feelings of abandonment shared by many adopted children.

And Remember:

All of God's creatures who travel, get weary and homesick when they roam. Any NW24T traveler here on this Earth, who remembered his home planet, could easily get homesick every day at sundown.

It is entirely possible that small groups of the Sami have been living in the northern arctic since before the end of the last ice age. Possible references to a small group of them appear in the records of ancient Rome.

However, the small group described by the ancient Romans appeared to have lost all semblance of social order, social structure, and had no survival skills passed down to them by their ancestors. The group described by the ancient Roman accounts, apparently did not farm, grow crops, build permanent warm houses, and so forth. I.E. they appeared to be totally lacking in appropriate survival skills.

According to ancient Roman accounts, the group was so primitive, they used only pieces of animal bones for arrow heads – not even stone arrow heads, as were used during the stone age. By contrast, The Ancient Peoples who were their neighbors, living at the same time, had used iron, steel, flint, and bronze arrow heads for several thousand years.

In short, the small group of people described by the ancient Romans, are described as being so primitive that they seem out of place with the humanity which surrounded them.

One wonders how a small group of such people could have survived in such fashion, and maintained their social distance from the surrounding humanity, for more than a small handful of years. Winters were cold and barren in northern Europe during ancient Roman Times. In order for any group of ancient people to survive for even a small handful of generations, they had to work closely together, sharing their carefully practiced set of survival skills. The ancient world was a very harsh place.

I wonder why none of those particular primitive people seem to have learned the necessary survival skills from their parents or from any of the surrounding tribes. It would have taken only one set of

parents, or a couple of grown, friendly, neighboring adults to teach all of them the necessary survival skills in a handful of days.

So, I have always wondered about the ancient Roman accounts. Consider how easy it is for children, as they grow up on this Earth, to learn how to take care of themselves by imitating their parents, their grandparents, their friends, and their elders. Farm children growing up in Wisconsin certainly did so.

Children quickly learn how to build houses, put up campsites, plant crops, feed and clothe themselves, group together to form a social structure and so forth, by imitating their parents, grandparents, and their elders, no matter what planet their parents or grandparents or elders may have grown up on. The group described by the ancient Romans could have also learned by imitating the Romans themselves, and assimilating in with the rest of the human tribes. Ancient Rome was certainly around for a long enough time.

Admittedly, ancient accounts may contain many errors, exaggerations, and omissions. However, the ancient Roman accounts may possibly contain some elements of truth.

I wonder if the original group of those particular primitive people described by the ancient Romans, actually grew up here on this Earth. I know it is highly speculative. However, I wonder if an original small group of primitive children had grown up on board a space craft while it was heading here to Earth, and the parents, grandparents, and other adults had perished during a failed landing attempt. The group of children, and young people on board who survived, would have been thrown together, alone, out into a harsh wilderness, with no friends, no teachers or guides, no one they trusted, no history, and no survival skills. Once panic set in, they would have had little choice but to do the best they could, while waiting to be possibly rescued.

For this speculative scenario to engage, all it would have taken is for a single incoming NW24T space craft to experience excessive G-forces during the landing attempt, killing only the older adults. A simple overheating electrical coil failure would have been all that was required. The young people on board could probably complete the landing. Young people can handle higher G-forces than older people.

Of course, the young people getting off the damaged space craft would have spent their entire young lives on board a properly functioning space craft. Once they were here on Earth, they wouldn't even know what good Earth soil looked like – or when to plant seeds.

All of the necessary survival skills which they would have needed in order to survive here on Earth during the time of the ancient Romans, would have vanished with the near instant deaths of the grown adult people.

Yet, sooner or later, the survival skills of the surviving NW24T extraterrestrials, and the survival skills of the surrounding human culture would have had, of necessity, to blend together.

I wonder. We humans always expect to find evidence of extraterrestrials visiting Earth by looking for evidence of advanced technologies, and advanced knowledge among ancient ruins and ancient peoples.

We seldom, if ever, consider looking for evidence of crashed extraterrestrial space craft and the resulting primitive survivors, among nearby tribes, or ancient accounts of primitive groups of people who seem to be out of place with their surroundings.

Yet, consider, the NW24T have been coming here to Earth in small groups for a long time. Any incoming NW24T spacecraft may very easily have been coming in slow, late, fast, or off course.

As the tilted Earth rotates, its surface moves towards the east. Consider the speculative case of an NW24T craft, approaching the Earth, on course from the northerly direction of Bernard's star, near the usual day of the summer solstice (June 21). In ancient times, the NW24T pilot would have been planning on landing over the ocean west of Norway. If the craft is coming in faster than planned, the NW24T pilot can slow down by increasing the forces generated by the propulsion engines. This is not a problem because the craft NW24T will simply be forced to land somewhere in Scandinavia or Russia or Siberia.

That is to say, the ancient incoming NW24T craft, which is coming in too fast, would have landed somewhere in the area of land which

is, today, being served by the First Sami Cultural center located at Inari, Finland.

However, if the craft is coming in too slow, the ancient NW24T pilot has no way to speed up. The craft, after all is traveling with the propulsion engines in the front. If the NW24T craft is coming in just a few minutes too slow, say 10 minutes, the NW24T pilot is in a very difficult position. On the one hand, the pilot must land at any price. On the other hand, because of the geography of the Earth's land surfaces, there is nothing but ocean water or glacial ice below him. The Earth below him is moving to the east at something like 10-15 miles per minute. The next decent place to attempt a landing is more than 3000 miles to the west, and most all of the distance in between is deep ocean.

In this speculative, but very possible case, the ancient NW24T pilot, while still out in space, might reasonably decide to slow still further, and make the landing attempt 6 hours or so, late. I.e., he might reasonably wait for the Earth to turn so that he will be landing on dry land in North America. In this case, the NW24T pilot would be landing his craft somewhere in lower Canada, or in the upper Midwest of America, such as in southern Wisconsin.

That is to say, the pilot of an ancient incoming NW24T craft, which is coming in too slow, might reasonably choose to land somewhere in the area of land which is, today, being served by the Second Sami Cultural center located at Duluth, Minnesota/Superior, Wisconsin.

Small wonder, then, that a number of our NW24T friends may still be encountered in Southern Canada or in Southern Wisconsin.

Therefore, any one of the NW24T craft which came here to Earth in bygone times, may have been forced to attempt to land here on Earth, in unwanted places in the northern hemisphere. That includes anywhere in Siberia, Northern Russia, Northern Canada, Scandinavia, or the British Isles. That even includes central Canada, or southern Wisconsin.

Before modern times, once things start going wrong on the landing attempt, then anything can happen.

There could easily be physical remains of ancient failed NW24T high-tech space craft landings with evidence of unusually primitive

ancient survival sites nearby, located all over the northern arctic regions, as well as all over the northern portions of North America.

My suggestion is:

Anytime humans find possible physical evidence of a high-tech spacecraft crash anywhere in the arctic wilderness (Siberia, Alaska, Canada, Norway, Finland, etc.) or the northern portions of North America such as Southern Wisconsin, they should consider searching for a possible primitive extraterrestrial survival site nearby. These primitive sites could be easily hidden in among other Indigenous sites. The reverse is also true. Namely, ancient sites that are unusually primitive may possibly be located near ancient extraterrestrial crash sites.

For example, in Southern Wisconsin, and other places, the ancient Indigenous people used to create Trail Trees and Trail Shelters. Indigenous people would bend saplings or the branches of lilac bushes or other young trees, to make living sign posts, or living primitive shelters for use when traveling, or on hunting trips, etc.

Such trail shelters could be used for short periods of time both winter and summer, in any weather. Since the trail shelters (and trail trees) were constructed using living bushes and living trees, they always stood ready for immediate emergency use, in the event that some ancient Indigenous hunting group was caught in an unexpected storm, or in need of emergency shelter. Trail trees and trail shelters, in effect, repaired and regenerated themselves, even if they were not used by their builders for many, many years.

The farm I grew up on in Southern Wisconsin had what appeared to be one such unusually large living trail shelter in one of our back wooded areas. We called that place "the alcove". When I was growing up, I used to seek its shelter and play in it, both winter and summer. I never felt alone when I was playing there.

Across the road, deep in Adam's woods could also be found at least 5 ancient Indigenous burial mounds, and a number of the stone arrow heads and other stone remains of their small nearby village.

Based on the age of the trees growing in that area of Adam's woods, I estimated the age of the burial mounds to possibly be more than 1000 years old. Indigenous tribes occupied Madison,

Wisconsin's Four Lakes area, and the shore of Madison's Lake Monona, for thousands of years. The oldest of those Indigenous clans had a legend which stated they lit their first council fires on the red bluffs in the vicinity of what is now the city of Green Bay, Wisconsin.

One of those ancient Indigenous clans, were named The Thunderbirds. They were known as the People of the Sky. They were the Peace Chiefs (i.e. the peacemakers).

The living trail shelter was large enough and tall enough for perhaps a dozen adults and children. The living trail shelter was adjacent to a large limestone wall-like outcropping. Altogether, the entire area could easily have provided temporary shelter to a party of ancient hunters as large as, perhaps, two dozen people. The limestone area was littered with ancient arrow heads, stone tools, and a few stone ax heads. There were a few apple trees and berry bushes nearby.

The trail shelter was strategically located on a natural site which could have been used as a hunting or traveling encampment. It was located on the side of a hill which overlooked a permanent fish filled lake, with a large marsh, which migrating wild ducks and wild geese used, spring, summer, and fall, for thousands of years. The marsh grew both rice-like cereal plants, and could grow some corn if it were planted by hand.

The lilac trail shelter, the pleasant fragrance of lilacs filling the surrounding breezes, hidden by the surrounding forest, would have functioned as a perfect camouflaged hunting blind for ancient Indigenous people, hunting geese or ducks during their seasons.

Before the coming of the Europeans, the entire site would have been surrounded by many miles of dense, unforgiving, nearly impassible forest. Probably the only access to the lilac trail shelter area would have been provided by animal trails or by following along the stream at the bottom of the hill, which fed the lake.

There were a small handful of other old dense stands of lilac trees which lay in other strategic places, along roads, hills and streams, in the nearby area as well.

The permanent lake was of moderate size. It had been there since at least the last ice age. The lake was on the upper reaches of the Mississippi river system with its ancient Mound Builders ruins. The Mississippi River lay off to the west.

This lake was a small part of the historically famous four lakes region around Madison, Wisconsin which lay within easy walking distance off to the north and east. The lake also provided easy access to the huge area which includes the great lakes, such as Lake Michigan. That area lay off to the east.

The entire southern Wisconsin area, which included the farm on which I grew up, contains numerous State Parks. These State Parks preserve numerous Indigenous Effigy Mounds. One of the most famous is named Aztalan State Park. It is located near Lake Mills, Wisconsin. It was easy walking distance from the shack which we later moved into, in London, Wisconsin. Aztalan is also located in, what would have been for an ancient Indigenous person, an easy walking distance from the lilac trail shelter which was located in "the alcove" on the farm of my childhood.

You see, the ancient Indigenous people were not children lost in the woods. They were hardy, well-traveled, intelligent hunters, builders, and mound builders who knew their geography, as well as their animals.

We typically think of the ancient Indigenous people, as cutting down trees and bushes to build friendly community things such as sign posts, mounds, wigwams, and other shelters. Maintaining such community things, using only stone tools, requires a significant number of people, and is very hard work.

The Indigenous people, though hardy, were few in number, typically living short hard lives. They lived among vicious animals which frequently attacked them. They were trying to survive in a huge expanse of unforgiving, densely forested, nearly impassable land.

The ancient Indigenous people, in order to make their lives easier, also constructed many things such as trail trees, sign posts, hunting traps, animal corrals, and trail shelters, etc. out of living plants. They did so by planting, bending, and shaping living trees, branches, and

bushes, and supporting mounds to fit their needs. These “trail” structures, constructed out of living forest plants, naturally repaired themselves. The living trail shelters also naturally concealed and protected them from the various animals, such as bears and bobcats. Southern Wisconsin has never had any dangerous poisonous snakes.

The ancient Indigenous people had apparently created the living trail shelter by intentionally forcing a group of large lilac bushes to grow in a manner that created more than a dozen separate rooms for campsites.

The entire trail shelter had a long narrow inner aisle, complete with easily protected doorways, entrances and exits. It was all created using living branches of the living lilac trees. The living tops of the lilac bushes had been intentionally interwoven to form a series of strong protective roofs and overhangs.

The trail shelter constructed from lilac bushes, was very old. Lilacs can live for a very long time. Lilac trees can live for more than 200 years. The lilac trail shelter appeared to me to be much older than the individual lilac trees themselves. The trail shelter could easily have been more than 400 years old. The oldest oak trees on our farm were between 1000 years and 2000 years old.

Consider for comparison: In 98 A.D. the Roman General Tacitus described a proto-Saami tribe known as the Fenni, as follows:

... Nor other shelter have they even for their babes, against the violence of tempests and ravening beasts, than to cover them with the branches of trees twisted together; this a reception for the old men, and hither resort the young... .

... Fenni seems to have been a form of the proto-Germanic word *fanþian-, denoting “wanderers” or “hunting folk”... .

. . the archaeological evidence suggests that the proto-Sami and Proto-Finns had a lifestyle more akin to Tacitus’ description... .

The branches twisted together which were described by Tacitus in 98 A.D. could today, easily be referred to as trail trees or trail shelters. Trail trees created by the ancient Indigenous people, are found in many places here in North America. So, it is entirely possible that extraterrestrial individuals such as the NW24T, who look and behave much like humans, have been living among us here on this Earth, intentionally blending in, in plain sight, for many thousands of years, without anyone, either humans or the extraterrestrial NW24T descendants themselves, being aware of it.

I would also speculate that in the time of Tacitus, 98 A.D., any small group of NW24T young adults who were crash survivors, having very few Earth based survival skills, could have very easily blended in with any of the Indigenous cultures. UFO hunters might begin by carefully studying trail trees and the areas which surround them. I wonder if any of the trail trees are associated with items made from gold or silver.

About The Author

Millennial Hospitality VI, NW24T, long awaited, looks further into the people, Charles referred to briefly in Millennial Hospitality III, The Road Home. Charles initially met several people with 24 teeth, who claimed to be from another planet, while still a teenager, in Wisconsin. MH VI, is full of easily traced information, which appears to support the assertion, that these people, exhibiting a genetic anomaly, distinguishing them from humans, have been visiting, & living ordinary lives, among us, for centuries.

Charles James Hall is a Nuclear Physicist, & IT specialist (retired). Outside of his family, he considers his writing on Hall Photon Theory, which promises to change how we view the universe, & explains how craft can be made to travel faster than the speed of light, to be his primary interest.

His writings on his interactions with extraterrestrials, first introduced in the early 2000s, caught worldwide attention, & he has enjoyed invitations to address audiences all over the world. He & his wife, of over 50 years, make their home in Albuquerque, New Mexico.

www.millennialhospitality.com

Dedicated to the greater honor and glory of God,
Who created all, extraterrestrials included.
